COMMERCIAL FERTILIZERS REPORT FOR 1931

THE FERTILIZER LAW IN CONNECTICUT

Fertilizer control in this State probably dates from 1869 when an "Act to Prevent Fraud in the Manufacture and Sale of Fertilizers" was approved by the General Assembly on July 8, and became effective on August 1 of that year. This law provided that commercial manures sold or kept for sale, if in packages of 50 pounds or over, should bear a special name or trademark, the name and place of business of the manufacturer or seller, the true analysis or specification of chemical elements and their several amounts, and the quantity of fertilizer in the package. A fine of \$10 for each 100 pounds of fertilizer sold in violation of these provisions, or for stating an analysis claiming 5% or more of any fertilizer ingredient than was contained in the package, was provided. The act did not apply to fish or pomace, or to any fertilizer made essentially from fish, or to any other commercial manure sold at a price not exceeding 1 cent per pound. The Secretary of the Board of Agriculture was authorized to procure the analysis of any fertilizer sold in the State and to prosecute any persons violating the provisions of the act. One-half of the fines imposed went to the State and one-half to the prosecutor.

At the winter meeting of the Connecticut Board of Agriculture held in Middletown January 11 to 14, 1870, the Secretary called attention to the recently enacted statute which he was directed to make public.

It is interesting to note in this connection that in 1856 Professor Samuel W. Johnson addressed the Connecticut State Agricultural Society at considerable length on the subject of "Frauds in Commercial Manures" and that he served as chemist to this Society and to its successor, the State Board of Agriculture, for many years. No doubt his activities formed the background for the enactment of this law.

The law was revised in some particulars in 1875 and in 1881, but no important revision was made until 1882. This act "Concerning Commercial Fertilizers" was considerably more comprehensive in scope than any of the previous acts. The first section of the new law is of particular interest because of its bearing upon

NOTE. Analyses were made by Messrs. Nolan, Mathis and Walden; microscopic examinations by Mr. Shepard and Miss Yale; inspection and sampling by Mr. Churchill; and compilations largely by Mrs. Vosburgh.

the recent concerted movement in the industry and among control officials to bring about a uniform and simplified method of stating fertilizer analyses for purposes of tagging the trade packages. It was provided that each package should bear a statement giving, among other information, the chemical composition of the fertilizer *in terms and manner approved by the Connecticut Agricultural Station*. In accordance with this provision the Station made the following announcement:*

"A statement of the percents of nitrogen, phosphoric acid (P_2O_5) and potash (K_2O), and of their several states or forms, will be satisfactory in most cases. Other ingredients may be named if desired.

"In all cases the percent of nitrogen must be stated. Ammonia may also be given when actually present in ammonia salts, and 'ammonia' equivalent to total nitrogen may likewise be stated.

"The percent of soluble and reverted phosphoric acid may be given separately or together, and the term 'available' may be given in addition to, but not instead of, soluble and reverted.

"Insoluble phosphoric acid may be stated or omitted.

"In case of bone, fish, tankage, dried meat, dried blood, etc., the chemical composition may take account of the two ingredients, nitrogen and phosphoric acid.

"For potash salts give always the percent of potash (potassium oxide); that of sulphate of potash or muriate of potash may also be stated.

"The chemical composition of other fertilizers may be given as found in the Station reports".

It is evident that fertilizer tags bearing the information required or permitted by the above announcement might become quite formidable documents to the average consumer, and such indeed was the case. Statements of composition became so complicated that erroneous inferences as to plant food present were sometimes drawn and difficulty and confusion in interpreting labels resulted. This led many States where similar provisions were in force to restrict the items that should be named, and we find in various fertilizer laws of later years items of composition required or permitted on tags or labels qualified by such phrases as "and no other ingredients shall be named" or words of like import. Our own fertilizer law as amended in 1919 includes this restrictive measure. It provides for the statement of nitrogen, equivalent ammonia, available phosphoric acid, total phosphoric acid and water soluble potash, prefaced by the restriction "only these items shall be given". This is a considerable curtailment of items formerly allowable, and it appears to permit of the interpretation that not

*Report for 1883, p. 12.

all of the items even now named in the law need necessarily be given, but that no more than these may be stated. The present law further provides that "methods of the Association of Official Agricultural Chemists in force at the time shall be followed in all statements of guaranties, sampling and analytical work required in connection with administering the law".

For a number of years the Association of Official Agricultural Chemists has been formulating definitions of terms and materials and striving to bring about greater uniformity in the expression and interpretation of results for fertilizers. The Association has made several regulations that bear upon the question of uniformity in the labeling of these products. It has been announced (1) that the "grade" of a fertilizer shall represent the minimum guaranty of its plant food expressed in terms of nitrogen, available phosphoric acid and water-soluble potash, and that the items shall be given in that order; and (2) that "statements of guaranty" for mixed fertilizers shall be in whole numbers.

In May of this year fertilizer control officials of the New England States, New York, Delaware, New Jersey, Maryland, Pennsylvania, Virginia and West Virginia, met with agronomists of these States and with representatives of the fertilizer industry at a conference held in New York. At this meeting the control officials adopted the following resolution after the various questions involved had been thoroughly discussed:

"Inasmuch as there is a strong desire and need for uniformity in enforcement of fertilizers laws:

"It is hereby resolved that the Fertilizer Control Officials of the following States: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, Delaware, New Jersey, Maryland, Pennsylvania, Virginia and West Virginia, in conference held in New York, May 20, 1931, favor the adoption of the following method of procedure in the registration of fertilizers and the administration of fertilizer laws:

"On and after January 1, 1932, applications for registrations for mixed fertilizers shall include only guarantees for minimum percentages of N, available P_2O_5 , and water-soluble K_2O ; and that all sacks or attached cards be labeled accordingly.

"Further, that trade or brand names shall include the formula grade in terms and order of N, available P_2O_5 , and water-soluble K_2O ; and it is recommended that these formula grades as well as guaranteed analyses shall be expressed in whole numbers or units, as, for example, 4-8-4, meaning 4 per cent N, 8 per cent available P_2O_5 , and 4 per cent water-soluble K_2O .

"In States requiring same, this may be supplemented by guarantees for total P_2O_5 , active and water-soluble N. Change in date of effectiveness being contingent on legislative action."

It was agreed that the control officials in each of the several States represented would issue as soon as possible following this conference, regulations for the respective States that would conform, as closely as local statutes would permit, to the joint resolution there adopted. Accordingly on June 25 this Station issued the following announcement:

"In view of the resolution passed by the Fertilizer Control Officials of the thirteen Northeastern States favoring (1) the statement of 'grade' as a part of the brand name of mixed fertilizers, e.g. XX Potato Manure 4-8-4; (2) that the significance of 'grade' shall be nitrogen, available phosphoric acid, and water-soluble potash, and in that order, e.g. XX Potato Manure 4-8-4 meaning 4% nitrogen (not 4% ammonia), 8% available phosphoric acid and 4% water-soluble potash; (3) that statements of grade and of guaranteed analysis shall be in whole numbers; and (4) that statements of guaranties shall include only minimum percentages of nitrogen, available phosphoric acid and water-soluble potash; and inasmuch as these recommendations are in accord with rules adopted by the Association of Official Agricultural Chemists, which rules are required by Sec. 5 of the Connecticut fertilizer law to be followed in administering the act; this Station will, on and after Jan. 1, 1932, observe the foregoing procedure and urge its adoption by all concerned with the manufacture, sale and distribution of fertilizers and by those charged with the dissemination of information concerning fertilizers and fertilizer problems.

"In accordance with this understanding and acceptance of terms and procedure this Station will expect (1) that mixed fertilizers offered for registration for the year 1932 and thereafter will carry as a part of the brand name, whenever possible, the grade of the mixture; (2) that the statement of the grade will be in whole numbers; (3) that the significance of the numerals expressing the grade, and the order of them, will be nitrogen (not ammonia), available phosphoric acid and water-soluble potash; (4) that the statement of guaranteed analysis will give the percentages, in whole numbers only, of nitrogen, available phosphoric acid and water-soluble potash, and in that order; and (5), that tags or stencils upon bags will agree with the registration.

"In the case of mixtures in which phosphoric acid is derived from sources (e.g. bone and tankage), in which available phosphoric acid cannot be adequately evaluated by present analytical methods, total phosphoric acid may be stated in the guaranteed analysis, and the statement of grade may be omitted. In the statement of grade, total phosphoric acid may not be substituted for available."

While this regulation applies to *mixed* fertilizers only, it is recommended that guaranties for raw materials follow the spirit of the ruling so far as may be. Nitrogenous raw materials, for example, should be guaranteed in terms of nitrogen, but not necessarily in whole numbers; bone and tankage should show guaranties expressed in terms of nitrogen and total phosphoric acid rather than ammonia and bone phosphate of lime as formerly.

In the case of mixed fertilizers in which the phosphoric acid is derived from materials such as bone, in which present analytical methods do not adequately evaluate available phosphoric acid, it was regarded as advisable to omit the statement of grade and allow total phosphoric to be given in the guaranteed analysis, preferably instead of available, but if desired, in addition to it. In any case the qualifying phrase, "All the phosphoric acid is derived from bone", is permitted.

The new plan is effective January 1, 1932, and it is felt that the simplification will be a benefit and aid to consumers and manufacturers of fertilizers and to officials charged with the enforcement of fertilizer control laws.

REGISTRATIONS

For 1931, 71 firms and individuals registered at this Station for sale in this State 424 brands of fertilizers. As required by statute the brands so registered are listed as follows:

American Agricultural Chemical Co., New Haven Sales Dept., New Haven, Conn.

AA Double Strength Tobacco Fertilizer
AA Top Dresser
AA Superphosphate 16%
AAC Aroostook Potato Manure
AAC Castor Pomace
AAC Complete General Fertilizer
AAC Double A Tobacco Fertilizer
AAC Dry Ground Fish
AAC General Crop Fertilizer
AAC Grass and Lawn Top Dressing
AAC Hi-Grade Tobacco Manure
AAC Monarch Fertilizer
AAC Muriate of Potash
AAC Nitrate of Soda
AAC Peerless Potato Manure
AAC Prolific 10% Potash Fertilizer
AAC Pulverized Sheep and Goat Manure
AAC Special Ground Bone
AAC Sulfate of Ammonia
AAC Sulfate of Potash
AAC Tobacco Starter
Agrico
Agrico for Aroostook
Agrico for Corn
Agrico for New England
Agrico for Trees and Shrubs
Agrico for Truck
Bowker's All Round Fertilizer
Bowker's Market Garden Fertilizer
Bowker's Stockbridge Early Crop Manure
Bowker's Stockbridge Hill and Drill Fertilizer
Bowker's Stockbridge Tobacco Manure
Bradley's Blood, Bone and Potash
Bradley's Complete Tobacco Manure
Bradley's Northland Potato Grower
Bradley's Potato Manure
Bradley's XL Superphosphate of Lime
National Complete Tobacco Fertilizer
Sanderson's Complete Tobacco Grower
Sanderson's Corn Superphosphate
Sanderson's Formula A
Sanderson's Formula B

American Cyanamid Company, 535 Fifth Ave., New York City.

Aero Brand Cyanamid
Ammo-Phos A
Ammo-Phos B
Ammo-Phos-Ko No. 1

INSPECTION OF 1931

The Station Agent has visited 87 towns and villages in the State and has drawn 436 official samples of fertilizer, including all the registered brands which could be found. The classification of these and of other samples analyzed is given in the summary.

CLASSIFICATION OF FERTILIZER MATERIALS, 1931

| | No. of samples | Page |
|---|-------------------|------|
| <i>I. Containing Chiefly Nitrogen:</i> | | |
| Nitrate of soda | 18 | 22 |
| Calcium nitrate | 18 | 22 |
| Calurea | 1 | 22 |
| Urea | 2 | 22 |
| Ammonium sulfate | 10 | 22 |
| Castor pomace | 51 | 22 |
| Cottonseed meal | 240 | 23 |
| Cyanamid | 1 | 22 |
| Linseed Meal | 13 | 23 |
| Horn and Hoof Meal | 2 | 23 |
| <i>II. Containing Chiefly Phosphoric Acid:</i> | | |
| Precipitated bone phosphate | 10 | 28 |
| Superphosphate | 15 | 28 |
| Basic Slag | 1 | 28 |
| <i>III. Containing Chiefly Potash:</i> | | |
| Carbonate of potash | 3 | 28 |
| Muriate of potash | 7 | 28 |
| Sulfate of potash | 5 | 28 |
| Sulfate of potash and magnesia | 1 | 28 |
| Cottonhull ashes | 89 | 33 |
| Wood ashes | 2 | 33 |
| Kainit | 1 | 28 |
| Miscellaneous | 18 | 28 |
| <i>IV. Containing Nitrogen and Potash:</i> | | |
| Nitrate of potash | 4 | 33 |
| Nitrate of potash and soda | 2 | 33 |
| Ground tobacco stems | 2 | 33 |
| Miscellaneous | 14 | 33 |
| <i>V. Containing Nitrogen and Phosphoric Acid:</i> | | |
| Dry ground fish | 66 | 36 |
| Tankage | 8 | 36 |
| Ground bone | 44 | 36 |
| Milorganite | 1 | 36 |
| <i>VI. Mixed Fertilizers:</i> | | |
| Containing nitrogen and phosphoric acid | 3 | 41 |
| Containing phosphoric acid and potash | 1 | 41 |
| Containing nitrogen, phosphoric acid and potash | 235 | 41 |
| Special and home mixtures | 48 | 45 |
| <i>VII. Miscellaneous:</i> | | |
| Sheep Manure | 17 | 64 |
| Lime | 22 | 64 |
| Other miscellaneous | 51 | 67 |
| Check meals and fertilizers | 42 | 67 |
| Total | | 1051 |

I. RAW MATERIALS CHIEFLY VALUABLE FOR NITROGEN.

NITRATE OF SODA

Nitrate of soda is commercial sodium nitrate containing not less than 15 per cent of nitrogen, chiefly as sodium nitrate. Natural deposits in Chili still supply this raw material, but it is also being made synthetically in large quantities both in the United States and in Europe from nitric acid and caustic soda or sodium carbonate. Synthetic nitrate of soda as made in the United States will contain about 16.25 percent of nitrogen.

The official samples analyzed contained over 15 percent of nitrogen and substantially met or exceeded guarantees. Nitrogen from this source, based on a very limited number of price quotations, has cost about 16 cents per pound.

Analyses are given in Table 1. Twelve unofficial samples are not included.

OTHER SOURCES OF NITROGEN

Other raw materials in this class are the synthetic products calcium nitrate (15% N), calurea (34% N), urea (46% N), and cyanamid. In calurea 80% of the nitrogen is in the form of urea and 20% is in the form of nitrate.

Analyses of official samples of these products are given in Table 1. Four samples submitted by purchasers are not included in the tabulation.

AMMONIUM SULFATE

This raw material may be made from by-product ammonia obtained in the manufacture of illuminating gas or from synthetic ammonia, gypsum and carbon dioxide. Arcadian sulfate of ammonia is a special grade, dried and screened to remove lumps and to secure good mechanical condition. Commercial grades will contain 20.5 percent of nitrogen. Nitrogen from this source has been valued at about 11 cents per pound this year.

Official samples analyzed are summarized in Table 2. All exceeded 20.5 percent of nitrogen.

CASTOR POMACE

When the oil is removed from castor beans the press cake is ground and becomes the castor pomace of the fertilizer trade. It is chiefly valuable as a source of nitrogen. Castor pomace contains an albuminous substance called ricin which is poisonous when introduced into the circulation. Although it is said not to be

toxic when eaten, instances of cattle poisoning are cited and it is generally recommended that it be stored where farm animals will not have access to it.

Fifty-one samples were examined, most of them submitted by purchasers. Analyses of official samples only are given in Table 3.

COTTONSEED MEAL

Analyses of nine official samples of cottonseed meal are given in Table 4. Two hundred and thirty-one samples tested for purchasers have been analyzed and the results reported to them and to the manufacturers.

LINSEED MEAL

No official samples of linseed meal were analyzed, but 13 samples were examined for purchasers.

HORN AND HOOF MEAL

This raw material made by processing, drying and grinding hoofs and horns contains from 10 to 15 per cent of nitrogen. No official samples were analyzed, but two samples were examined for purchasers.

II. RAW MATERIALS CHIEFLY VALUABLE FOR PHOSPHORIC ACID

Analyses of official samples of superphosphate are given in Table 5. One sample was examined for a purchaser.

Included in the same table are three official samples of precipitated bone phosphate and one of basic slag. Seven samples of precipitated bone examined for purchasers are not listed in the tabulation.

III. RAW MATERIALS CHIEFLY VALUABLE FOR POTASH

POTASSIUM SALTS

Carbonate of potash in a pure, dry condition contains 68 percent of actual potash (K_2O) but commercial grades as sold for fertilizer purposes usually contain from 62 to 65 percent. Official samples examined this year contained from 64.5 to 67.2 percent. A fair valuation for potash from this source is 10 cents per pound.

Muriate of potash of fertilizer grade contains from 48 to 50 percent of actual potash. Seven samples examined exceeded 48 percent in all cases and generally exceeded 50 percent. Potash from this source has been valued at 4½ cents per pound.

Sulfate of potash should contain not less than 48 percent of potash and not more than 2.5 percent of chlorine. Guarantees of 48 percent were exceeded in all the official samples analyzed. Chlorine varied from 1.87 to 2.54 percent. Potash in sulfate of potash has been valued at about 6 cents this year.

Sulfate of potash and magnesia is a fertilizer potash salt containing about 25 percent of potash. The one official sample analyzed was guaranteed 26 percent and was found to contain over 28 percent. The chlorine content was 2.09 percent. The limit of chlorine is the same as that for sulfate of potash, viz., 2.5 percent.

Kainit is a potash salt that has not been used so much in recent years as formerly. It is of variable composition and will usually contain from 12 to 16 percent of potash. It is supplied from German and French mines. The one official sample examined contained 14.02 percent of potash and was guaranteed 14 percent.

Analyses of official samples are given in Table 6. Samples submitted by purchasers, 18 in number, are not included in the tabulation.

COTTONHULL ASHES AND WOOD ASHES

Cottonhull ashes are used quite extensively in this State as a source of potash. Some of this material varies considerably in composition and it is often sold on a unit basis for that reason. When guaranties are made they are usually set at 20 to 25 percent of potash. One of the samples examined was very low grade.

So far as we have data on prices the cost per unit to purchasers has been from \$1.75 to \$2.25 per unit. At \$2.00 per unit the cost of potash is 10 cents per pound.

Analyses of official samples are given in Table 7. Samples submitted by purchasers, 83 in number, are not included in the tabulation.

No official samples of wood ashes have been analyzed but two samples submitted by purchasers were found to be of good quality. They contained 4.8 and 4.9 percent of potash with 30 to 40 percent of calcium oxide.

IV. RAW MATERIALS CHIEFLY VALUABLE FOR NITROGEN AND POTASH

Nitrate of potash contains not less than 12 percent of nitrogen and 44 percent of potash (K_2O).

Some of the Chilean deposits of nitrate are mixtures of nitrate of soda and nitrate of potash. Commercial nitrate of soda-potash consists of about 3 parts nitrate of soda and one part of nitrate of potash and contains about 14 percent of nitrogen and 10 percent or more of potash.

Tobacco stems will supply about 150 pounds of plant food per ton and have been used for many years as a fertilizer material. The official samples examined this year contain from 1.5 to 3.0 percent of nitrogen and 5 to 5.5 percent of potash.

Official samples of materials in this group are listed in Table 8. Fourteen samples submitted by purchasers are not included in the tabulation.

V. RAW MATERIALS CHIEFLY VALUABLE FOR NITROGEN AND PHOSPHORIC ACID

FISH, TANKAGE, BONE, ETC.

Dry ground fish is a fertilizer material made from non-edible fish and the offal from fish canneries. It generally contains 8 percent or more of nitrogen and 5 to 6 percent of phosphoric acid.

None of the samples examined this year were found adulterated with inorganic nitrogen.

Analyses of official samples are found in Table 9. Analyses of 54 samples analyzed for purchasers are not included.

Tankage is a fertilizer material derived from refuse meat and bone. Where meat predominates this fertilizer will contain 8 to 10 percent of nitrogen with 5 to 10 percent of phosphoric acid. If bone predominates there will be more phosphoric acid present and less nitrogen. All of the official samples examined this year were of the high nitrogen order. Occasionally ammonium sulfate has been found in quantity to suggest adulteration, but no such evidence was found this year.

Analyses of official samples are given in Table 10.

Raw ground bone is made by drying and grinding animal bones that have not been previously steamed. Steamed bone meal is made by steaming bones under pressure, after which they are dried and ground. Steamed bone meal contains considerably less nitrogen than raw bone meal.

Analyses of official samples of ground bone are given in Table 11. In addition to these official samples, 28 samples of bone meal have been analyzed for purchasers and are not listed in the table.

Milorganite is an activated sludge and the analysis of an official sample showed 5.39 percent of nitrogen and 2.74 percent of phosphoric acid. There was 4.96 percent of organic nitrogen insoluble in water, 62 percent of which (3.08%) was active by laboratory methods. The material was guaranteed to contain 5 percent of nitrogen and 2.75 percent of phosphoric acid.

VI. MIXED FERTILIZERS

SUPPLYING NITROGEN AND PHOSPHORIC ACID

Three official samples of mixtures supplying only nitrogen and phosphoric acid were examined.

6730. Ammo-Phos A made by the American Cyanamid Co., New York. It was guaranteed 11 percent nitrogen and 46 percent available phosphoric acid and contained 11.10 percent nitrogen and 48.81 percent of available phosphoric acid.

7316. O. & W. Tobacco Starter, made by Olds & Whipple, Inc., Hartford. This mixture was guaranteed 8.23 percent nitrogen and 3 percent available phosphoric acid and contained 8.50 and 4.31 percent of these elements respectively.

7141. Swift-Sure Tobacco Starter, made by M. L. Shoemaker and Co., Philadelphia, Pa., was guaranteed 3.28 percent of nitrogen and 10 percent of available phosphoric acid, and 3.21 percent and 10.65 percent of these elements respectively were found.

SUPPLYING PHOSPHORIC ACID AND POTASH

One official sample of a mixture supplying only available phosphoric acid and potash was analyzed.

6738. Eastern States 0-14-6, made by Eastern States Farmers' Exchange, Springfield, Mass., was guaranteed to contain 14 percent of available phosphoric acid and 6 percent of potash and contained 14.01 percent of available phosphoric acid and 6.28 percent of potash.

SUPPLYING NITROGEN, PHOSPHORIC ACID AND POTASH

(Analyses are given in Table 12.)

In this group are 235 official samples of registered brands. The results of the inspection and analyses are briefly summarized in the following tabulated statement:

| | |
|--|-----|
| Total number of samples analyzed | 235 |
| Samples considerably deficient in | |
| one item | 53 |
| two items | 8 |
| three items | 0 |
| Total items of plant food guaranteed (235 x 3) | 705 |
| Total items found deficient: | |
| nitrogen | 29 |
| available phosphoric acid | 18 |
| potash | 22 |
| Total guaranties substantially met or exceeded | 636 |
| Per cent of guaranties substantially met or exceeded | 90 |
| Samples showing approximate commercial deficiencies exceeding \$1.00 per ton | 7 |
| Per cent of samples deficient by more than \$1.00 | 3 |

This summary shows that of 705 individual guaranties of plant food in official samples analyzed, 636, or 90 percent, were substantially met or exceeded.

In only 7 samples did the commercial valuations of deficiencies exceed \$1.00 per ton. This is a little less than 3 percent of the total samples analyzed.

In estimating commercial values in mixed fertilizers ammonia was reckoned at 18 cents per pound and available phosphoric acid and potash at 5 cents per pound each.

The distribution of chemical deficiencies is given in Table 12a.

TABLE 12a. SUMMARY OF CHEMICAL DEFICIENCIES

| | % of prod. | % of nitres | Deficiencies in— | | | Per cent of guaran- ties met |

SAMPLES SHOWING COMMERCIAL DEFICIENCIES

Samples showing commercial deficiencies in excess of \$1.00 per ton, estimated as already described, are as follows:

| | | |
|------|--|--------|
| 6717 | Davey Tree Food | \$2.18 |
| 6741 | E. S. 8-16-16 | 1.38 |
| 7214 | E. S. 10-5-10 | 1.88 |
| 7452 | E. S. 10-5-10 | 8.29 |
| 6653 | Lowell Top Dressing 7-6-5..... | 1.23 |
| 6913 | New England Market Garden Manure 5-8-7..... | 2.08 |
| 7176 | Standard Wholesale Phosphate and Acid Works, Jumbo Potato Grower | 1.04 |

COMMERCIAL DEFICIENCIES, 11 YEAR PERIOD

Commercial deficiencies for a period of 11 years are summarized in Table 12b. Manufacturers not having 10 or more samples analyzed in the 11 year period are not included. Commercial deficiencies each year are reckoned by balancing shortages against overruns in plant food, using accepted trade values, and disregarding net shortages of \$1.00 or less per ton. In the accompanying table it appears that, for the manufacturers listed, 94 percent of all the samples examined in 11 years have shown no commercial deficiencies, or none in excess of \$1.00 per ton.

TABLE 12b. COMMERCIAL DEFICIENCIES FOR THE PERIOD 1921-1931

| Manufacturer | Total number of samples | Number equaling or exceeding guarantees in money value | Per cent for 11 yr. period | No. of samples for 1931 | Per cent for 1931 |

SPECIAL AND HOME MIXTURES

These samples, 48 in number, are chiefly tobacco fertilizer mixed according to special formulas and submitted by the purchasers for analysis. A few home mixtures are also included. In all such cases the analyses have been reported by the Station to the purchaser, and to the mixer if known. Special mixtures are made from registered raw materials but the mixtures themselves are not sold under brand names.

The analytical data on these samples are not tabulated.

^a No samples for 1931.

■ No samples for 1930 or 1931.

▪ For four years.

VII. MISCELLANEOUS FERTILIZER, AMENDMENTS, ETC.

SHEEP MANURE, ETC.

Seventeen samples, all official, have been analyzed and the results are summarized in Table 13. Guaranties were met or exceeded in nearly all cases. Three samples failed to meet guarantees for potash.

LIME

Limestone and agricultural lime are not classed as fertilizers in this State and no official inspection is required. The Station for many years, however, has taken samples of liming materials and published the analyses for purposes of record and for the information of those interested.

Sixteen samples were taken this year by the Station agent and the analyses are given in Table 14. Six other samples were analyzed for individuals but the results are not included in the table because no information as to their source was given.

OTHER MISCELLANEOUS MATERIALS

Other miscellaneous materials, 47 in number, have been examined chiefly for persons who were interested to know of their possible value for fertilizer or for amendment purposes. Farm manures, tobacco stems and dust, humus, and factory wastes were the principal items submitted.

COLLABORATIVE WORK

Thirty samples of check cottonseed meals and 12 samples of check fertilizers have been analyzed in the collaborative programs of the American Oil Chemists Society and the F. S. Royster Guano Co.
