Bulletin 616

June, 1958

REPORT ON INSPECTION
COMMERCIAL FEEDING STUFFS
1957

H. J. FISHER
Chief Chemist

THE CONNECTICUT AGRICULTURAL EXPERIMENT STATION
NEW HAVEN

Clause (4) refers to feed ground from materials furnished by the consumer.

Under clause (5) feed is regarded as "mixed to order" and must be so tagged together with the name of the customer for whom it is mixed, or otherwise identified to distinguish it from regular brands offered for general sale. Such feed must be sold only to the customer for whom it was mixed; if sold to others it becomes a regular brand and subject to registration and other provisions pertaining to feeds in general.

REGULATION 2. METHOD OF LABELLING (Sec. 6741)

All concentrated commercial feeding stuffs, other than vitamin D carriers, must be labelled either by a statement printed on the bag or upon a properly attached tag; in the case of concentrated feeding stuff sold in bulk, a certificate which shall contain the information otherwise required to appear upon the bag or upon the tag, may be issued by the dealer in lieu thereof.

The use of wire or any metal in affixing tags is prohibited by law.

The law requires a statement of (1) the net weight of the feed contained in the package; (2) the name, brand or trademark, under which the feed is sold, (3) name and address of the manufacturer or importer; (4) the minimum percentages of (a) crude protein and (b) crude fat, and the maximum percentage of (c) crude fiber contained in the feed; (5) the separate ingredients of which the feed is composed.

While the law requires only a statement of the items enumerated above, no objection will be raised to more complete statements of chemical composition or formula.

REGULATION 3. CONCERNING VITAMIN D CARRIERS

Vitamin D carriers are required to be registered in the same manner and under the same conditions as obtain for feeds in general

Information to be given on labels and in applications for registrations is (1) name of product; (2) vitamin D potency in terms of A. O. A. C. chick units per gram; (3) name and address of manufacturer, distributor or other person responsible for the product; and (4) on the label, a statement of net weight or volume.

The A. O. A. C. chick unit is the vitamin D activity produced by one U. S. Pharmacopoeia unit of vitamin D from the U.S.P. "Reference Cod Liver Oil", determined by the method of assay adopted by the Association of Official Agricultural Chemists.

REGULATION 4. CONCERNING COTTONSEED MEAL, ETC.

Cottonseed meal, linseed meal, soybean meal, and other vegetable feeds that are sold as fertilizer, are required to be registered under the provisions of the fertilizer law in addition to registration as feeds. If

sold exclusively for one or the other of these purposes, the articles may be registered only under the law which applies.

For such of these articles as are used for fertilizer purposes chiefly or entirely as sources of nitrogen, only nitrogen (or protein) need be declared in the application for registration as fertilizer; and the tags or labels generally attached to such articles when intended for feeding purposes will be acceptable for them when sold as fertilizer.

REGULATION 5. DUTIES OF MANUFACTURERS, JOBBERS AND DEALERS WITH REFERENCE TO REGISTRATION (Sec. 6742)

All concentrated commercial feeding stuffs, including vitamin D carriers, must be registered with The Connecticut Agricultural Experiment Station annually on January 1, or before they are offered for sale. Registration blank forms are supplied by the Station.

Manufacturers, jobbers or individuals shipping feeds into Connecticut will be expected to register their brands and pay the necessary fees thereon. *Connecticut dealers should assure themselves that the brands they handle are properly registered and labelled. In case the manufacturer or jobber outside the State neglects or refuses to register, the dealer who handles such feeds will be held responsible for such registrations, registration fees and other legal requirements.*

Dealers within the State who mix their own brands are responsible for the registration and proper labelling thereof.

REGULATION 6. DEFINITIONS OF TERMS USED IN THE LAW AND OF OTHER TERMS

Person. The term "person" imports the singular or the plural as the case demands; and includes corporations, companies, societies and associations.

Importer. The term "importer" is defined in the act.

Brand. It is held that a distinct brand name, or a distinct analysis, constitutes a distinct brand.

Definitions for Feeding Stuffs. The definitions and standards for feeding stuffs adopted from time to time by the Association of American Feed Control Officials are accepted as official in carrying out the provisions of this law; and the rules and regulations as adopted by that association are accepted as far as possible and when not inconsistent with the Connecticut Statutes.

REGULATION 7. METHODS OF ANALYSIS (Sec 6741)

The methods of analysis employed shall be those prescribed by the Association of Official Agricultural Chemists, wherever such methods have been adopted for the determinations desired

REGULATION 8. CONCERNING MEDICATED FEEDS AND MINERAL MIXTURES

The law does not include medicated products used as "conditioners" for stock and poultry, and which consist essentially of substances possessing, or claimed to possess, medicinal or condimental properties; nor does it include products consisting of supplemental minerals.

REGULATION 9. FEEDS IN DIFFERENT PHYSICAL FORMS

The same feed offered in different physical forms, e. g., mash and pellets, requires but one registration.

REGULATION 10. REVISIONS AND SUBSTITUTIONS OF REGISTRATIONS

A feed registration after being filed may be revised without payment of an extra registration fee.

A brand of feed duly registered and subsequently discontinued may be replaced by another brand for the unexpired period of registration without payment of an extra registration fee.

REGISTRATIONS

For the period January 1, 1957 to December 31, 1957, 229 firms registered 1,625 brands of feeding stuffs, and 32 firms registered 61 brands of vitamin carriers.

SUMMARY OF INSPECTION

In the calendar year 1957, a total of 2,077 samples was examined—180 more samples than in 1956. This total included official samples of commercial feeds, carriers of vitamin D and other vitamins, and miscellaneous materials as shown in the following summary:

Biological specimens analyzed for poison.....	144
Check feeds, A.A.F.C.O., etc.....	11
Commercial feeding stuffs, official samples.....	994
Miscellaneous feeds, etc., analyzed for purchasers.....	168
Oat products.....	7
Pasture grass, etc., samples for Storrs Station.....	679
Vitamin carriers.....	74
	2,077

Samples examined for Storrs Station are in connection with investigations carried on by that Station and are not for discussion in this report.

Commercial Feeding Stuffs

Prior to 1957 medicated feeds were not required to be registered. All animal feeds, whether medicated or not, have always been subject to the Connecticut Food, Drug and Cosmetic Act as well as the Feeding Stuffs Law, and when the practice of adding small proportions of drugs to regular poultry feeds to act as prophylactics against disease began to develop in 1949 it was decided to waive registration of such mixtures under the Feeding Stuffs Law and to treat them solely as drugs to be controlled by the Food and Drug Commission under the Food, Drug and Cosmetic Act. This practice continued up to the present year; registration of medicated feeds was not required, but they were sampled regularly by drug inspectors and their drug contents checked by analysis at this Station and the results published in special tables in our annual feed reports.

The enormous increase in late years in the proportion of feeds for all animals to which numerous synthetic drugs, antibiotics, etc., were being added to accomplish varying purposes led us to realize that medicated feeds could no longer be treated as a small special class for which a waiver of registration was justifiable. This waiver was therefore revoked in a notice sent to feed manufacturers shortly prior to the 1957 registration season, and for the calendar year 1957 and thereafter all feeds (whether medicated or not) have been and will be required to be registered.

This has considerably increased the analytical load in the laboratory, because not only have there been more samples to analyze but in most cases more determinations per sample have had to be made. Other results from this change have been a delay in appearance of this report and a need to rearrange the tabular data. Where the reports of previous years have listed analyses of unmedicated feeds in one table and those of medicated feeds in several others, this year analyses of all official feed samples (except vitamin concentrates and oat products) have been combined in one "Table 1". Unfortunately because of space limitations this could only be done at the expense of eliminating the usual listing of the names of the retail dealers from whose stocks the samples were obtained, but we hope that this omission has been compensated for by the greater ease in locating the data on individual feeds.

The results of our analyses of these samples can be summarized as follows:

Total number of samples.....	994
Samples deficient in:	
one item.....	143
two items.....	12
Percentage of samples meeting guaranties.....	84
Total guaranties made.....	3,240 ¹
Guaranties not met:	
protein.....	31
fat.....	77
fiber.....	20
2-acetylamino-5-nitrothiazole ("Enheptin A").....	1
arsanilic acid.....	6
copper sulphate.....	2
nicarbazin.....	10
nicotine.....	1
3-nitro-4-hydroxyphenylarsonic acid.....	4
nitrophenide.....	1
4-nitrophenylarsonic acid ("Histostat").....	8
phenothiazine.....	2
sulfaquinoxaline.....	3
sulphur.....	1
	167
Percentage of guaranties met.....	95

Largely because of the systematic examination for the first time of medicated feeds, 56 more official samples were analyzed in 1957 than in 1956. The general picture with regard to deficiencies did not change significantly, however: The percentage of satisfactory guaranties was 95 as against 96 in 1955 and 1956, and deficiencies in fat were still the most common (77 in 1957 and 63 in 1956).

Chemical analyses are given in Table 1; deficiencies are shown in bold face type. (Tolerances used were 0.75 per cent for protein and fiber, 0.25 per cent for fat, and \pm 20 per cent of guaranty for drugs and other minor ingredients.)

¹ One sample with six guaranties, 73 with five guaranties, 117 with four guaranties, 796 with three guaranties, six with two guaranties and one with no guaranty (guaranties for antibiotics not included).

Vitamin Carriers

Seventy samples of vitamin D carriers were assayed for this vitamin by official methods, using day-old chicks for poultry feed supplements and rats for supplements for four-footed animals. Fifteen of these samples guaranteed one or more vitamins in addition to vitamin D, and results of our assays for these vitamins (riboflavin, niacin and pantothenic acid) are included in Table 2 under the respective samples. This table also lists four samples which contained no vitamin D; two of these were sold as sources of riboflavin and niacin, and one each as a source of riboflavin alone and of riboflavin plus niacin plus pantothenic acid.

Only two samples out of the 70 failed to meet their guaranties for vitamin D. This is a 97 per cent passing ratio, as against 94 per cent found in 1956. During the entire 21-year period from 1937 to 1957 inclusive that such vitamin D assays have been run, 1,113 samples have been examined, of which 1,007, or 90 per cent, have been passed.

On the basis of a ± 20 per cent tolerance for other vitamins, no sample was found to be deficient in riboflavin, niacin or pantothenic acid, but five were high in niacin alone (one of these samples did not guarantee vitamin D), three contained too much riboflavin and niacin, and one each was high in riboflavin alone and in riboflavin plus niacin plus pantothenic acid. Of the total of 74 samples, therefore, two were low in vitamin D and 10 were high in other vitamins, leaving 62 samples, or 84 per cent, that were passed in all respects. Ninety-three out of the total of 110 guaranties, or 85 per cent, were met.

Oat Products

Because "meals made from whole grains when not mixed with other materials or with each other" are exempt from registration, we do not have a record of all brands of ground oats that are sold in this State. However, since it was known that adulteration of this product with oat hulls and even mineral matter has been prevalent at times in the past, each year since 1956 we have made a point of examining materials being sold as "ground oats". During 1957 seven such samples were analyzed with results as shown in Table 3. Only two samples failed to meet their guaranties; one of these was very low in protein and high in fiber, while the other was slightly deficient in fat. However, it should be noted that while the normal fiber content of commercial feed grade ground oats is only 12.1 per cent¹, four of the 1957 samples contained considerably higher percentages than this: 13.53 to 16.10 per cent. It is doubtful if more than three of this year's samples (one of which was slightly low in fat) were straight ground oats with no excess hulls.

Miscellaneous Feeds

One hundred and sixty-eight unofficial samples of feed and fodder materials were examined. This total included commercial feeds carried over from stock purchased by dealers prior to 1957, other

¹Frank B. Morrison, "Feeds and Feeding", 22nd Ed., p. 1058 (1956)

mixed feeds and feed ingredients analyzed at the request of purchasers and dealers, and samples of hay and silage submitted by farmers. Two samples were examined for the Federal Correctional Institution at Danbury for compliance with their purchasing specifications, ten samples were analyzed for the State Supervisor of Purchases, and sulfaquinoxaline was determined for the Food and Drug Commission in five medicated feeds.

Results on the following samples may be of interest:

533. *Beef Meal—80% Protein.* Joseph Price, New Britain, Conn. Protein, 78.96; water, 4.76; ash, 7.73; fat, 7.61; fiber, 0.93, and nitrogen-free extract, 0.01, per cent.

532. *Desiccated Liver.* Joseph Price, New Britain, Conn. Protein, 65.63; water, 3.34; ash, 4.62; fat, 11.24; fiber, 0.26, and nitrogen-free extract, 14.91, per cent.

1582. *Nibco Five Star Super Starter.* Berkman Grain Co., North Franklin, Conn. Riboflavin found, 269 micrograms per 100 grams. Various authorities¹ list the riboflavin requirement of chicks as between 250 and 360 micrograms per 100 grams of feed.

535. *Popped Corn.* Joseph Price, New Britain, Conn. Protein, 8.94; water, 4.89; ash, 1.38; fat, 24.76; fiber, 1.76, and nitrogen-free extract, 58.27, per cent.

As usual, a number of materials were submitted because they were suspected of having caused the illness or death of animals. Tests for deleterious substances were completely negative on all samples except three:

Two of these were hays (44 and 45) from the farm of Frederick Berggren of Ansonia that Mr. Berggren suspected were making his cows ill; no poisonous ingredient was identified by chemical analysis, but because benzene extracts of both hays killed flies it was considered probable that traces of an unidentified organic pesticide were present.

The third sample was a feed (232) submitted in connection with the death of a cow belonging to Henry Haas of Southwick, Mass. Microscopically this feed appeared to be straight ground barley, but spectrographic analysis showed the presence of 50 parts per million of barium and 35 p.p.m. of lead, indicating probable contamination with paint.

Biological Specimens Examined for Poisons

One hundred and forty-four biological specimens were examined in connection with suspected poisoning, mostly of domestic animals and poultry. In 54 of these, poisonous substances were found in sufficient quantity to suggest probable or possible causes of death.

The poisonous materials, and the number of specimens in which they were found, are summarized as follows: Alpha naphthyl thiourea

¹Bird *et al.*, "Poultry Science", 25, 47 (1946); Bethke *et al.*, *Ibid.*, 21, 147 (1942); Sebrell and Harris, "The Vitamins", vol. III (1954).

("ANTU") (2), alpha naphthyl thiourea with zinc (1), arsenic (3), arsenic with copper (Paris green) (1), arsenic with lead (arsenate of lead) (1), barium with lead (1), cadmium with mercury (1), copper with zinc (1), lead (17), lead with zinc (3), mercury (8), parathion (1), phenothiazine (1), strychnine (1), thallium (1), tin with zinc (1), warfarin (1) and zinc (9). The predominant poison was lead, with 22 cases.

The one case of lead arsenate poisoning involved some bees, which were found to contain 8 parts per million of arsenic and 15 p.p.m. of lead. The parathion was actually found in a sample of soil, which contained only 0.02 part per million of this substance; this soil was, however, indirectly related to the deaths of a large number of birds (five starlings, seven purple grackles and a goose) and one dog which had drunk water from a puddle that had formed on land sprayed with this insecticide. The strychnine case was that of a dog; 400 parts per million of the alkaloid were found in the stomach contents. The one warfarin case, which was also that of a dog, is worthy of note because normally we do not test for that compound for the reasons that the test is time-consuming and that in any case only repeated consumption of a warfarin bait is likely to cause death; the test was run in the present instance because the veterinarian's observation that the dog's blood would not clot had strongly suggested the presence of this anti-coagulant.

Check Feeds

Nine feeds were analyzed in the check feed program sponsored by the Association of American Feed Control Officials, and two samples of alfalfa were assayed for carotene in a program also sponsored by that association.

DETERMINING GUARANTIES

The most reliable way to determine safe guaranties for feed mixtures is by analysis. Larger manufacturers with laboratory facilities follow this method. Small manufacturers and home mixers are without such facilities and they must resort to other means. A close estimate can be made by a simple calculation using as a guide the analysis tags on the ingredients to be mixed.

If, for example, a mixture is to be made with cottonseed meal, corn meal, ground oats, gluten feed and wheat bran as ingredients, we may assume that the tags for these several ingredients show the following percentages of protein, fat and fiber:

Ingredient	Protein per cent (lbs. per 100)	Fat per cent (lbs. per 100)	Fiber per cent (lbs. per 100)
Cottonseed meal.....	41	7	11
Corn meal.....	24	2	11
Ground Oats.....	12	5	11
Gluten Feed.....	25	2	7
Wheat bran.....	16	5	10

Remembering that per cent means pounds per 100 pounds, then 100 pounds of each of the materials listed above will contain the number of pounds of the several nutrients shown.

If the formula to be mixed calls for the pounds of ingredients shown in column 1 below, then the pounds of the several nutrients will be as shown in columns 2, 3 and 4. The total weight of the mix is seen to be one ton (20 hundred pounds), so the analysis of the finished product is found by dividing the totals by 20, or by moving the decimal point one place to the left and dividing by 2.

Example

Column 1	2 Protein lbs.	3 Fat lbs.	4 Fiber lbs.
Cottonseed meal..... 200 lbs.	82	14	22
Corn meal..... 200 lbs.	48	4	22
Ground oats..... 600 lbs.	72	30	66
Gluten feed..... 300 lbs.	75	6	21
Wheat bran..... 700 lbs.	112	35	70
Totals..... 2,000 lbs.	389	89	201
Per cent.....	19.45	4.45	10.05

Mixers should remember that for protein and fat the guaranties are minimum values; for fiber the guaranty is the maximum. In other words, the manufacturer guarantees that protein and fat will not be less than the percentages declared, and in the case of fiber that it will not exceed the figure declared.

TABLE 1. ANALYSES OF COMMERCIAL FEEDS, INSPECTION OF 1957
