4. Ground fish, bone, etc.	50
5. Mixed fertilizers	54
6. Sheep and cattle manure	84
7. Limestone and similar materials	90
8. Other miscellaneous materials	92
9. Phosphoric acid distribution in potato grade fertilizers	94

Analyses were made by Messrs. Richard A. Botsford, Sherman Squires, Werner Mueller, Charles Hahn and Miss Helen Kocaba; inspection and sampling by Mr. R. Richard Nichols; compilations by Mrs. Marilyn Fishbone.

REPORT ON INSPECTION AND ANALYSIS OF  
COMMERCIAL FERTILIZERS

1965

Part II: List of Registrants, Tonnages Sold, and Analyses

H. J. Fisher, Chemist Emeritus

INTRODUCTION

For the first time last year the annual fertilizer report was issued in two parts:<sup>1</sup>

Part I consisted of a table listing the number of fertilizers sampled, the number of guaranties made for these samples, the number of samples found deficient, and the average percentage of the claimed guaranties found present, for each manufacturer: this table did not show actual analyses of individual brands. This circular was designed with two purposes in mind: It would enable a quick comparison of the products of different manufacturers with regard to which gave the best value for the money after allowance was made for the fact that an excess over guaranty of one ingredient could offset a deficiency in another; and it could be prepared for publication more quickly than the former type of report, and therefore be in the fertilizer user's hands soon enough to be useful in guiding his purchases. A similar circular has been issued covering the 1965 inspection.

For those who desired the actual analytical results on individual samples, the names and addresses of all registered (and some unregistered) manufacturers, tonnage data, etc., Part II of the 1964 report was issued as Bulletin 671; the present bulletin covers the same data for the 1965 inspection.<sup>2</sup> These bulletins follow more closely the annual reports of previous years, but they differ in one important respect, namely, that in the table on mixed fertilizers all fertilizers of each grade ratio are placed together. Each bulletin also contains a special table on the water-soluble phosphoric acid content of certain grades that was requested by potato growers.

Comments on this new method of reporting are still solicited.

CONNECTICUT LAW AND REGULATIONS REGARDING  
COMMERCIAL FERTILIZERS

The term "commercial fertilizers", as used in the Connecticut fertilizer statute, includes "any and every substance imported, manufactured, prepared or sold for fertilizing or manuring or soil amendment purposes, except barnyard manure and stable manure which have not been artificially treated or manipulated, marl and lime." An amendment of the law in 1949 permitted fertilizers to be labelled with guaranties of elements other than nitrogen, phosphorus and potassium, but did not change the requirement that mixed fertilizers must contain at least 0.82 per cent of nitrogen, and 1 per cent of either phosphoric acid or potash, for guaranties of these elements to be made. Phosphorus must be declared as available phosphoric acid (except in the case of bone, tankage and other

<sup>1</sup>Conn. Agr. Expt. Sta. Circular 226 (1965); Bulletin 671 (1965).

<sup>2</sup>Conn. Agr. Expt. Sta. Circular 228 (1966).

natural organic materials, where total phosphoric acid may be guaranteed instead), and potassium as water-soluble potash; all other elements must be guaranteed in terms of percentages of the elements, not as oxides or salts. A registration fee of \$10.00, payable annually, is charged for each element guaranteed in each brand of fertilizer; there is also a six cent tonnage tax payable semi-annually.

While manufacturers usually register their own fertilizers, if a retailer sells a fertilizer manufactured by an out-of-state firm, and that firm refuses to register, under the law the retailer is responsible for registration fees and tonnage taxes. The retailer, therefore, should assure himself that the requirements of the law have been met by the manufacturers of the brands which he handles, or himself be prepared to meet all these requirements.

The law exempts from registration, and from other requirements, only: (1) fertilizers passing through the State in transit; (2) fertilizers and fertilizer materials shipped to regular fertilizer factories to be used for manufacturing purposes; and (3) fertilizers and fertilizer chemicals sold to The Connecticut Agricultural Experiment Station for experimental purposes.

Cottonseed, linseed, peanut and soybean oil meals, when sold or used for fertilizer purposes must be registered as fertilizers and the specified fees paid thereon. For such products the registration fee is \$10.00 per brand. This fee and the tonnage tax are entirely apart from the registration fee required by the feeding stuffs law for vegetable meals used as feeds (there is no tonnage tax on feeds).

Because manufacturers or jobbers do not know how much, if any, of their vegetable meal tonnage is sold or used as fertilizers, local dealers and purchasers report their sales or purchases to this Station. This information is not for publication but is used to inform manufacturers of the total sales of their meal as fertilizer in this State. It is expected that the fees provided for by statute will be paid by the manufacturer or other party responsible for the brands.

#### OFFICIAL DEFINITIONS OF FERTILIZER TERMS AND MATERIALS

It is expected that fertilizers sold in this state will comply with the regulations and standards of the Association of American Fertilizer Control Officials. A copy of the "Official Publication" of that Association giving these definitions and regulations may be obtained from the secretary-treasurer, B. D. Cloaninger, Drawer 392, Clemson, South Carolina, for \$4.00.

#### FIRMS AND REGISTRATIONS

For 1965, 127 firms registered 735 brands of fertilizer for sale in this State. The following list gives the names and addresses of these manufacturers and the brands registered by them. Included also are the companies and brands whose products were not registered because they were sold only in packages of 10 pounds or less net weight; these are distinguished by being starred. Listed also are a few companies whose products were not in small packages but failed to be registered. Brands not in small packages that were unregistered for any reason are marked with a /.

## GRADES OF FERTILIZER USED IN CONNECTICUT

The Connecticut fertilizer law does not provide for compulsory limitation of the grades that may be sold in this State. Nevertheless (until recently, at least) there has been general agreement that a small number of grades can take care of all of the needs of agriculture, and that standardization on a few grades will promote economy of manufacture, with the consequent possibility of lower prices. In contrast to this, the last few years have seen the rise in some States of so-called bulk blending plants which mix fertilizer ingredients to the order of individual farmers according to proportions determined by soil analyses. Whether this type of custom mixing will spread in Connecticut with its smaller farms remains to be seen.

To promote grade standardization the New England agronomists have from time to time compiled lists of recommended fertilizer rations and minimum grades. The last such list, which was drawn up at a meeting in Burlington, Vermont on June 19, 1961, was as follows:

Ratio	Most Common Grade
0-1-1	0-20-20
0-1-2	0-15-30
0-1-3	0-10-30
0-1-4	0-10-40
0-3-1	0-30-10
1-1-1	10-10-10
1-2-2	5-10-10
1-4-2	3-12- 6
2-1-1	10- 5- 5
2-1-2	6- 3- 6
2-3-3	8-12-12
3-2-2	15-10-10
3-4-4	6- 8- 8
4-2-3	16- 8-12
4-3-1	8- 6- 2

Seventy-six per cent of the mixed fertilizers sold in this State during the 1964-1965 season were of the recommended ratios in grades whose plant food content equalled or exceeded the specified "most common grades". Three other grades, each of which sold over a thousand tons (5-10-5, 8-10-10 and 23-7-7), accounted for another 11 per cent. The numerous additional grades accounted for only 14 per cent of the total tonnage. This tonnage was less than that for the 1964 season by 6,249.

During the past season the Station agent collected samples of all registered brands that could be found on the market. The total number of official samples was 702.

The following tabulation lists the number of samples analyzed (both official and unofficial) of each class of fertilizer, as well as the tonnage sold during the period between July 1, 1964 and June 30, 1965:

## TONNAGES OF FERTILIZER MATERIALS AND MIXED FERTILIZERS PURCHASED DURING THE PERIOD OF JULY 1, 1964 - JUNE 30, 1965

	No. of Samples	Tonnage	
I. Containing chiefly nitrogen:			
Nitrate of ammonia	5	363	
Nitrate of soda	3	265	
Sulphate of ammonia	5	18	
Calcium Nitrate	1	--	
Cyanamid	2	217	
Urea	10	467	
Nitrogen solutions	-	746	
Castor pomace	3	393	
Cottonseed meal	46	2,956	
Linseed meal	9	281	
Soybean meal	3	355	
Dried blood	2	3	
Horn and hoof meal	1	8	
Other materials	5	142	
			6,214
II. Containing chiefly phosphoric acid:			
Superphosphate 18%	-	2	
"                  20%	10	2,810	
"                  46%	10	359	
Dicalcium phosphate	4	---	
Phosphate rock	1	65	
Precipitated bone	2	114	
			3,350
III. Containing chiefly potash:			
Carbonate of potash	2	---	
Muriate of potash	6	227	
Sulphate of potash	3	3	
Sulphate of potash-magnesia	1	-	
Cotton hull ashes	6	188	
			418
IV. Containing nitrogen and phosphoric acid:			
Bone meal	20	290	
Diammonium phosphate	2	14	
Dry ground fish	7	10	
Other materials	-	1,090	
			1,404
V. Containing nitrogen and potash:			
Nitrate of potash	8	63	
Nitrate of potash-soda	1	17	
			80
VI. Mixed fertilizers:			
Commercial mixtures	563	52,209	
Special and home mixtures	47	9,188	
			67,397
VII. Miscellaneous:			
Aluminum sulphate	1	9	
Borax	1	13	
Fritted iron preparations	-	2	
Sheep and cattle manure	34	1,821	
Limestone and similar materials	12	--	
Other miscellaneous materials	17	--	
Check meals and fertilizers	26	--

		Total	688
		Grand total	52,209

## COMPLIANCE WITH GUARANTIES

The table in Circular 228 was designed to indicate at a quick glance the relative performances of the various manufacturers by two bases of measurement: (1) The total numbers of deficiencies found in their samples; and (2), the extent (expressed as percentage) to which their products offered more or less fertilizer value than was claimed, when allowance was made for the offsetting of an excess of one major element by a deficiency in another. This table gives no actual analytical figures, and does not indicate the specific brands and grades in which the summarized deficiencies occurred. Such a table probably offers a means of comparison that is both simpler and fairer than the summaries and table-underlinings of previous years. It is however wholly derivative, and does not supply the data for checking its conclusions. Partly to furnish these missing data, and partly just to supply information on the composition of specific brands, analyses of the actual official samples with their indicated deficiencies are given in Tables 1 to 6 of the present bulletin. Comments on these tables follow:

## I. Materials Chiefly Valuable for Nitrogen

Analyses of 71 official samples of nitrogenous materials are given in Table 1. Fifty-nine of these met their guaranties and 12 were deficient. The substandard samples included 9 of cottonseed meal, two of ammonium nitrate and one of "Cascio's Organite."

## II. Materials Chiefly Valuable for Phosphoric Acid

Analyses of eight official samples of 20 per cent superphosphate and five of the 46 per cent grade, four of dicalcium phosphate, and one of phosphate rock, are given in Table 2. Of the total of 18 samples, 14 met their guaranties; three 46 per cent, and one 20 per cent, superphosphates were deficient.

## III. Materials Chiefly Valuable for Potash

Six samples of muriate of potash, two of sulphate of potash, and one each of carbonate of potash, sulphate of potash-magnesia, fritted potash and cotton hull ashes, were analyzed with results as shown in Table 3. Nine samples were passed; one sample each of carbonate of potash, muriate of potash and sulphate of potash was deficient.

## IV. Materials Supplying Nitrogen and Phosphoric Acid

This group consists chiefly of dry ground fish and bone meal. For natural products such as these, guaranties of total instead of "available" phosphoric acid are permissible. Eighteen official samples of bone meal, four of dry ground fish and two of diammonium phosphate, were analyzed in 1965 with results as shown in Table 4. All samples were passed with the exception of one of diammonium phosphate that was low in nitrogen.

## V. Materials Supplying Nitrogen and Potash

Four samples of nitrate of potash and one of mixed potassium and sodium nitrates were analyzed; all of the nitrate of potash samples met their guaranties, while the potassium-sodium nitrate mixture was deficient in potash. Analyses are given in Table 3.

## VI. Mixed Fertilizers

### Commercial Mixtures

Analyses of 538 official samples of mixed fertilizers are given in Table 5. This table includes both samples taken from larger bags and small-package material. The samples have been grouped so as to place together all samples of each grade ratio.

Results of these analyses are summarized as follows:

Total number of samples		538
Samples deficient in:		
one item	165	
two items	40	205
Percentage of samples meeting all guaranties		62
Total guaranties made <sup>1</sup>		1,592
Guaranties not met:		
nitrogen	90	
phosphoric acid	130	
potash	16	236
Percentage of guaranties met		85

Thirty-two samples guaranteed magnesium (mostly 1.2 per cent) in addition to the major components; all were passed. Eighteen samples declared between 0.01 and 0.50 per cent of iron: there was no actual deficiency, but the proportion of iron present was usually many times the guaranty. Seventeen samples claimed between 0.00 and 0.45 per cent (mostly 0.02 per cent) of boron; all guaranties were met. One sample listed 2.75 per cent of sulphur. In addition, there were multi-minor-element fractional percentage guaranties as follows (one sample each): boron, copper, iron and zinc; boron, iron and zinc; boron and iron; iron and sulphur; iron and zinc. All of these samples were passed.

## VII. Miscellaneous

### Sheep and Cattle Manures

Manures must bear guaranties of nitrogen, either total or "available" phosphoric acid, and potash. Of the 32 official samples analyzed during the 1964-1965 season, 27 met all guaranties, two each were low in nitrogen and phosphoric acid respectively, and one was deficient in both these components. Analyses are given in Table 6.

<sup>1</sup> Five hundred and sixteen samples with three guaranties and 22 with two guaranties (minor element guaranties not included).

## Limestone and Similar Materials

The Connecticut Fertilizer Law specifically excludes "marl and lime" from its jurisdiction, but the Station occasionally analyzes samples of limestone, hydrated lime and gypsum submitted by farmers or state or Federal agencies. Twelve such samples received in 1965 are reported in Table 7.

## Other Miscellaneous Materials

Analyses of 17 unofficial samples of miscellaneous materials of possible or suspected fertilizer value are given in Table 8. This table also includes one official sample each of aluminum sulphate and borax.

Recent field experiments conducted by the University of Connecticut have indicated that the proportion of the available phosphoric acid in potato fertilizers that is present in water-soluble form is a significant factor in determining the yield of potatoes on land to which such fertilizers have been applied. At the request of Dr. Arthur Hawkins of the University, all of this year's official samples of the 5-10-10, 6-8-8, 8-12-12 and 10-10-10 grades were analyzed for water-soluble phosphoric acid in addition to running the usual total and citrate-insoluble determinations. The results so obtained are reproduced in Table 9 for the inspection of potato growers and others interested in this breakdown. (It should be noted that all samples in this table are also listed in Table 5.)

The usual collaboration with check analyses programs was continued. Samples analyzed included 16 vegetable meal samples received from the American Oil Chemists' Society, and 10 check fertilizers supplied by the National Plant Food Institute.
