CONNECTICUT COURT REPORTERS ASSOCIATION

AGENDA

III. Addressing Trauma

ROBERT PYNOOS, M.D. & M.P.H.; Co-Director,
National Child Traumatic Stress Network

STEVE MARANS, M.S.W., Ph.D.; Harris Professor of
Child Psychology/Professor of Psychiatry/Director,
National Center for Child Exposed to
Violence/Childhood Violent Trauma Center - Yale
University

(Hearing recommences after lunch)

CHAIRMAN JACKSON: Why don't we reconvene for the
afternoon session. We have a panel discussion including
Dr. Robert Pynoos, Steven Marans, Julian Ford, and Robert
Franks. Dr. Pynoos, the floor is yours.

DR. ROBERT PYNOOS: Thank you. I'm deeply honored
to be here today to contribute to the important work of this
Commission. Along with John Fairbank, it is my privilege to
co-direct the UCLA Duke University National Center for Child
Traumatic Stress which, for over a decade, has led -- has
helped lead and coordinate the National Child Traumatic
Stress Network, which is a federally funded initiative
administered by the U.S. Department of Health and Human
Services through SAMHSA, the Substance Abuse and Mental
Health Services Administration. I speak not only today from
my perspective of 30 years, also as the Director of the UCLA
Trauma Psychiatry Program, but also as a dedicated
clinician, parent and citizen who wants our society to
provide the healthiest environment for our children,
families, schools and communities.

During my presentation, I will first summarize
what we've learned about children and families exposed to
violence, trauma and loss and advances that have been made
in approving science, improving services and intervention.

Second, I will summarize some of the many lessons we've
learned over the past 30 years about planning and
implementing recovery programs for children, families,
school personnel and school committees after catastrophic
school violence. And third, I'd like to provide some
information about the National Child Traumatic Stress
Initiative. I hope to provide a framework for the in-depth
discussion, of key issues and recommendations from the three
speakers to my right; all of whom, along with their
distinguished individual work, have been critical
collaborators in the National Child Traumatic Stress
Network, and one of your Commission members, Dr. Alice
Forrester, also directs one of our centers.

As the Commission moves more of its attention to
mental health, the field of child traumatic stress, I think,
has important contributions to make this discussion and set
of recommendations. These contributions not only include
the understanding of the psychological and health
consequences of exposure to catastrophic violence, but it
also includes an understanding that prevention, early
identification, screening, and high quality care must be a
major part of any effort to break cycles of violence that
emanate from interpersonal and community violence, family
violence and political violence coming, I think, full circle
to some of the issues the Commission first addressed.

1 You know, the whole world responded in a profound
 2 manner to what occurred at Sandy Hook Elementary School, and
 3 I'd like to offer you that the profundity of the response
 4 stems not only from the unimaginable catastrophic violent
 5 deaths of school staff and young children, but from the
 6 deeply universal investment that all children, parents and
 7 society have in the expectation of what we call a protective
 8 shield in the lives of young children.

9 Young children look to the protection of their
 10 parents against all kinds of dangers and harm, be it from
 11 illness, accident or intentional violence. Parents expect
 12 to be able to ensure that protective shield even if they
 13 recognize there's no guarantee. For parents, a failure in
 14 their protective shield profoundly disturbs expectations,
 15 generates vigilance about danger, promotes ongoing
 16 preoccupations with prevention, safety and protection. It
 17 can be the same for children of all ages. The enrollment of
 18 one's children in school, camp or other activities outside
 19 of parental supervision represents a transfer of this
 20 responsibility into the hands of others; one that's not easy
 21 for parents and requires a balance of trust and concern.

22 The whole staff of elementary schools feels the
 23 enormous responsibility of this transfer of the protective
 24 shield. We know from previous catastrophic violence that
 25 elementary schools and school administrators, teachers and

1 weapon firings directly and through the intercom was a
 2 prominent feature of the experience with this potential
 3 impact on the control of the startle response. Repeated
 4 startle response is, I will tell you, are in themselves
 5 debilitating. They affect behavior, learning and even a
 6 child's self-image.

7 In the aftermath of school violence, children,
 8 parents and school personnel and whole communities live in a
 9 world of often unavoidable reminders of the traumatic
 10 experiences and the depth of loss. Trauma reminders come in
 11 many forms; a sound, like I mentioned before, a face, a
 12 situation, other persons that you were with at the time, be
 13 it teachers of the children in the classrooms, be it parents
 14 in their reunion with their children. These are reminders
 15 within the family and within the school, and of -- they're
 16 reminded by something on TV, in the movies or in the
 17 Internet of another horrific event has just happened in
 18 Boston.

19 It's hard enough for adults to know how to manage
 20 their reaction to reminders to find a way to tell themselves
 21 the difference between what happened before and what's
 22 happening now. Children are at even more of a disadvantage
 23 and often must count on adults to help them with this
 24 important task in managing their daily lives after
 25 catastrophic violence. When reminded, heart rates can zoom

1 all the school staff experience a deep injury to their
 2 professional identity similar to that experienced by parents
 3 when their protective shield fails. We also know it takes a
 4 long time, much longer than sometimes appreciated, to
 5 restore this sense of a protective shield. In fact, I'd
 6 suggest the work of this Governor's Advisory Commission is a
 7 critical societal response in rebuilding trust in this
 8 protective shield.

9 There is a growing avid science behind how our
 10 brains mature to take on the challenges of protecting
 11 ourselves against danger. Exposure to violence can have,
 12 for example, a profound effect on the startle response of
 13 children and adults. The brains of young children is
 14 designed to startle to loud noises and suddening,
 15 threatening motions to make sure that children turn from the
 16 danger and run towards others who can protect them. It's
 17 actually not until nearly eight years of age when the brain
 18 starts to develop pathways to inhabit that startle. That's
 19 eight long years, not really until 12 until it's
 20 consolidated. Now, one can consider turning, as a result,
 21 toward the danger to try to do something to protect yourself
 22 by intervening. And we have preliminary evidence that the
 23 brains of children exposed to trauma may actually be delayed
 24 in acquiring this control over the startle.

25 In the case of Sandy Hook, the noise of assault

1 up, and a helping hand of a parent or teacher may be
 2 critical to calming down. These reminders put the child
 3 again and again on alert, not only during the day, but in
 4 their pattern of sleep so they do not wake up rested. And
 5 it's not hard to imagine that restless sleep often
 6 accompanied by nightmares results in a child being irritable
 7 during the day, making it hard to concentrate and learn.

8 In adolescence, we know these reactions to
 9 reminders can take the form of aggressive and reckless
 10 behavior. If you now couple changes in the brain with the
 11 pernicious and pervasive effects of trauma reminders, you
 12 have the ingredients for a very challenging world for the
 13 developing child. Bouts of fear can make them into a
 14 different child. Parents are telling -- in Newtown will say
 15 that about their children today. It will make the school
 16 day much more difficult, and it needs to be recognized that
 17 it challenges parents in ways never anticipated; to have an
 18 eight-year-old have a bout of fear when you're in a mall and
 19 acting like a -- what seems like a three-year-old, you
 20 can't -- you aren't talking to a three-year-old. It's very
 21 challenging to parents to know how to manage and be at most
 22 help to their children in those circumstances.

23 Children, especially young children, often
 24 experience trauma in situations when in the company of
 25 family members and other caregivers. We have come to

1 recognize the powerful and long-term impact of children who
2 witness violence to their parents and other caregivers.

3 In the new American Psychiatric Association DSM V,
4 diagnosis of PTSD actually gives a special place to this
5 form of trauma in the lives of young children. In the
6 aftermath, both child and adult have their own unique set of
7 trauma reactions, each responding often to different
8 reminders that complicates their lives together.

9 Consider what it's like for a child and mother
10 after the mother is raped in the presence of a child. That
11 happens, let me tell you, thousands of times a year in the
12 United States. The child has a nightmare in the middle of
13 the night, runs in to seek comfort from the mother who
14 awakens suddenly and, for a moment, reacts with a recurrence
15 of terror of the rape. She then tries to comfort her child
16 while her heart rate is just racing and then feels awful in
17 not being able to be the calming mother she has always known
18 herself to be.

19 I bring this up, this example up, because in
20 addition to the individual assistance with their own private
21 traumatic experiences, mother and child need the help to
22 recover together. This mutual interdependence in regard to
23 recovery is similarly important not only to families, but I
24 will tell you to teachers and students, to classrooms, and
25 of the school community.

1 decades, we've learned that children and adolescents can
2 manifest the full range of posttraumatic stress reactions;
3 that these reactions can be validly and reliably measured
4 and that specialized trauma-focused interventions can bring
5 about clinically significant improvement in symptoms,
6 behavior and daily functioning, including school behavior
7 and performance.

8 DSM V now recognizes that even children six years
9 and under can suffer from PTSD, although their presentation
10 has unique developmental features in these very young
11 children. In addition, studies of the mental health effects
12 on disaster, war, terrorism and community violence indicate
13 that PTSD is often associated with separation anxiety in
14 young children, even older children, and that older children
15 often suffer from depressive reactions as well.

16 There are very successful treatments for these
17 young children, especially in designed parent/child
18 interactive forms of psychotherapy, and for the older
19 children in the kinds of interventions that Dr. Marans is
20 going to be speaking of as well.

21 While much attention is given to PTSD and
22 depression -- often that comes at the end of the
23 discussion -- loss of life, especially under horrendous
24 circumstance adds a whole different dimension. I spent much
25 of my early career learning how to assist children, parents,

1 Let me add one more dimension, how the minds of
2 even young children grapple with the issues of the social
3 contract in the aftermath of violence. A two-and-a-half
4 year old child witnesses for the first time her mother
5 beaten by her father. When the adults -- what the adults
6 would like to believe is that she's too young for it to have
7 had an effect. The next morning, this young child not only
8 refuses to go to preschool and wants to stay with their
9 mother whose face is all bruised, but also declares though
10 her mother's absolute surprise daddy hit mommy. Mommy call
11 police. It's a two-and-a-half year old. These are real
12 events. I give this example, indeed, because it's stated in
13 the Los Angeles Police Department's motto to protect and
14 serve. The role of law enforcement and society's obligation
15 operates in even the mind of the youngest children.

16 One of your next speakers, Dr. Marans, can speak
17 volumes about the successful partnership in Connecticut and
18 across the United States in child trauma and mental health
19 programs and law enforcement in meeting the mental health
20 needs of violent-exposed young children, and I would say for
21 the child's sake and for society's sake, in the years to
22 come, to restore constructive youth of the social contract.

23 All of these traumatic reactions to violent
24 exposure can coalesce into reactions that we call
25 Posttraumatic Stress Disorder. Over the past several

1 families and school personnel after homicide, including from
2 violent assaults at schools. We saw over 200 children who
3 had seen their parents murdered. We had worked at many
4 homicides in school playgrounds and other places that I'll
5 mention. We know a lot more now about the dual challenge of
6 addressing the cruel and intentional manner of death and
7 still trying to grieve the loss and how exceedingly
8 difficult it is to address both.

9 It's helpful to keep in mind the unique and shared
10 features of mourning and grief. Mourning is something
11 public, shared and often prescribed by culture, religion,
12 community and family practices that extends over time.
13 Mourning serves the wider community in addition to those who
14 are more directly grieving. Grief reaches out beyond the
15 perimeter of the violent circumstance, and is most intensely
16 and privately experienced based on one's closeness to the
17 person or persons who died. This is true for children as
18 well as adults. However, the timing of mourning rituals,
19 what you do publicly is often quite at odds to the private
20 course of grief after traumatic deaths. So, it's really a
21 mismatch, often over time, of what happens under those
22 circumstances. Something that the Newtown community will be
23 facing.

24 Over the years, we've learned that even young
25 children who lost a parent, a sibling, close friend or

1 teacher grieve. And just on the same side, just like we've
 2 learned to be cautious over overscribing PTSD to a large
 3 community, we have the similar caution in overscribing the
 4 need to intervene for a school or school district with grief
 5 counseling. Most children and adults may be feeling the
 6 sense of mourning shared by the community but not suffer
 7 from the private pain of grief that accompanies closeness.

8 Furthermore, from studies around the world, we've
 9 learned that violent deaths result in much higher rates for
 10 parents, for children, for school personnel of persistent
 11 and complex difficulties in adapting to the loss that goes
 12 on for years. And over the past decade, however, we've
 13 developed advances in both how to measure and how to
 14 intervene with children, parents and school personnel after
 15 such horrific deaths.

16 I know my colleague, Marleen Wong, provided you
 17 with a diagram illustrating the various -- varying course of
 18 psychological reactions over time that can occur from
 19 pre-event to the first days post-event through the next
 20 several years, but I'd like to add some additional points to
 21 her presentation.

22 Every disaster, catastrophic school violence, has
 23 a distinctive signature in terms of what we call a dose of
 24 exposure; that is, within an affected school community,
 25 there are differences in life threat, in being injured,

1 the groups at Newtown Elementary School that were further
 2 back in the school, were not only sheltered in their
 3 classrooms, but they were put into closets by their teachers
 4 for protection, had the highest level of reaction -- had the
 5 next highest level of reaction initially, as you can see,
 6 but these children showed a much greater recovery over the
 7 first year. It started to really look very different than
 8 that first group that were the most highly exposed.

9 These and similar findings indicate that
 10 school-based mental health recovery programs need to be
 11 stratified in terms of expectations, types and duration of
 12 selective interventions, (inaudible), and learning the
 13 timing of additional educational support. So, as the
 14 exposed group, the highest exposed group, had the most
 15 interference with learning start to recover, they often need
 16 additional educational supports at a time that it can make
 17 use of them. So, the timing of those are very important in
 18 the recovery program of a school.

19 And then I also -- whereas the most exposed group
 20 witnessed death and injury had intrusive images of what they
 21 saw and what they witnessed to their -- to other children
 22 and injury and death, the wider school community, this whole
 23 group, shared a common fear of reoccurrence that was -- ran
 24 across exposure groups and extended for quite a period of
 25 time, but those are two very different objectives in trying

1 witnesses of injury and death to others, worrying about a
 2 significant other, injury to and loss of friends and family
 3 members.

4 Let me give an illustration from one of the
 5 earlier studies we did. I think Dr. Wong may have mentioned
 6 this, but in 1984, we worked in a school in Los Angeles
 7 where a sniper, using a semiautomatic weapon, shot from an
 8 apartment across the street onto a playground of children as
 9 they were leaving school. And we had children that were on
 10 the playground, in the school thrown into closets, who were
 11 leaving the playground -- leaving school from a different
 12 exit and not exposed, and children in this all-year school
 13 that were not in school that day, and we could follow their
 14 course.

15 I just want to use this as an illustration. You
 16 can see that there was a modern to high level of
 17 posttraumatic stress reactions in the first month among all
 18 of the school children; however, the most highly exposed
 19 children had the most severe reactions with a more chronic
 20 course that persisted into the second year and probably
 21 beyond. And what characterized them was not only intrusive
 22 images, but severe sleep disturbances and interference in
 23 learning in very significant ways that didn't continue among
 24 the other groups.

25 The in-school group, not so different than some of

1 to be able to help the school recover.

2 And you can see that that top group is the group
 3 you're going to hear from, I think, Steve Marans and others,
 4 and Allie can speak to -- requires the kind of specialized
 5 care that our centers are really very, very good at. And
 6 you always have to ensure that level of care, which I will
 7 tell you, in schools after schools, doesn't always happen.
 8 There's more a general school response, but not a stratified
 9 approach that allows you to choose the right intervention
 10 for the right level of effect. And then you add grief to
 11 that because this shows you the experience of life threat
 12 and witnessing of injury and death, the grief affected the
 13 siblings very differently, best friends, siblings,
 14 relatives, cousins, and that had a very different pattern.
 15 That had to do with how close you were, and that needed to
 16 be well worked out and addressed as well. But we did know,
 17 and what we know from many studies is that when you have
 18 trauma and grief, that the trauma makes the grief and the
 19 recovery more difficult. And if you're trying with the
 20 resources that requires, as all of us know personally, to
 21 handle the grief, even as a young child, it makes the
 22 recovery from trauma more difficult. So, when you're faced
 23 with both, it's a very difficult challenge and requires real
 24 mental health resources and support through the school.

25 In disaster studies, we found the same type of

1 dose of exposure, varying course of recovery, impact of loss
 2 on children, parents and school personnel alike. So, the
 3 school personnel has the same kind of stratification that's
 4 needed. But we also have to recognize, and we know this,
 5 that the impact on the parents or the caregivers or school
 6 personnel has a direct relationship as well to the recovery
 7 of children. So, how well are your teachers doing in their
 8 recovery, who well are your parents doing has an effect on
 9 how well the child is recovering. And we know that children
 10 are actually really good observers about how their school
 11 personnel are doing, as much as they are observers sometimes
 12 of how their parent is doing.

13 Moreover, I'd like to say that we look to support
 14 professional groups that may be especially affected and
 15 critical of the recovery environment. The addition of first
 16 responders, clearly in this situation, deserve much
 17 attention. It's suggested that of such horrific loss of
 18 life, the pediatricians are one such group. They are a key
 19 part of early family life, and are likely deeply affected by
 20 the density and the intensity of loss of life within their
 21 own practices, within their own community of pediatricians.
 22 And they're a critical group, not -- so, they not only need
 23 help with themselves, but they're a critical group at the
 24 frontline to identify children and families under stress and
 25 who need additional support. And I'm sure that Dr. Franks,

1 who a leader in working with pediatricians, will, at least
 2 in part, address how to train and support them in this
 3 community.

4 Let me make a few key points to explicate some of
 5 the ones made by Dr. Wong a number of weeks ago. One, the
 6 school is a critical recovery environment where children
 7 spend much of their day. It's an academic environment, but
 8 after an event like this, it's where they're spending six to
 9 eight hours a day. It is a major recovery environment for
 10 the child, just as the family is under other circumstances.
 11 And that we know that -- what Dr. Wong had said that the
 12 studies are now unified and show that violence and traumas
 13 have a deleterious effect on school behavior and academic
 14 performance and that PTSD and depression produce even more
 15 profound effects. It means that behavioral and academic
 16 recovery go hand in hand. One can't look at one side or the
 17 other side without making a unified effort in the timing of
 18 how to support both.

19 It also means preparedness. If you look at this,
 20 it means preparedness and recovery plans need to include
 21 short and long-term programs. That means from day one, even
 22 prior. From day one, you're already planning for two or
 23 three years down the road. You can see that in this
 24 pattern. You need to be thinking about that, knowing who
 25 and how you're going to plan for those long-term

1 consequences, not only thinking that everybody runs to a
 2 school in a crisis circumstance that you're doing immediate
 3 work, you need to be thinking long term and you need to make
 4 systematic plans for that and that they're stratified and
 5 sustained interventions.

6 I will tell you that in an elementary school, it's
 7 the slow recovery of that sense of a protective shield means
 8 that elementary school recovery programs need to be designed
 9 to be multi-year. They can't be a single year as sometimes
 10 happens in high schools. They need to be multi-tea year,
 11 and they need critically to be designed to provide special
 12 assistance both psychologically and academically in the
 13 transition to intermediate school; one of the most important
 14 transitions in school life.

15 And if you just focus on the six-month period --
 16 if you look at that middle dots, I want you just to look at
 17 that. You can see the real challenge that emerges in a
 18 recovery environment is to establish a mutual understanding
 19 and tolerance for very different courses of recovery. The
 20 same is, again, true for school personnel and for parents.
 21 They have challenges because teachers are in different
 22 places. School staff are in different places. Parents are
 23 in different places. And I'm sure the Newtown community is
 24 already experiencing some of the tensions that are so easily
 25 generated by the varying courses of recovery within a

1 community.

2 So, setting up tolerances isn't just compassion.
 3 It means people most affected understanding, and others,
 4 sort of, are ready to go ahead. And those who are ready to
 5 go ahead understanding that others have really been more
 6 seriously affected, and it's going to take them much longer
 7 to set up that kind of tolerant school, community, wider
 8 community response actually takes effort on everybody's
 9 part.

10 We also know that injured children and school
 11 personnel have special challenges; that reintegrating peers
 12 who have been injured requires a concerted programmatic
 13 attention and leadership from within the school. I would
 14 say that's true as well for school personnel. It has to be
 15 a very dedicated effort to reintegrating injured children
 16 back into their peer community.

17 We've also learned over and again that there needs
 18 to be a dedicated recovery program for school personnel
 19 that's independent of the efforts on behalf of the children.
 20 Independent means you can't be doing just workman's comp.,
 21 which doesn't provide confidentiality in the same way. It
 22 has to be independent. They know they can go and get help
 23 for their own recovery at their own pace, and it's not the
 24 same person seeing the children. It's somebody who is
 25 dedicated to them because it's very hard for them to speak

1 on their own confidentially when you're seeing the children
2 as well. So, that's a very dedicated line of support.

3 I was concerned after Newton -- I know there are a
4 lot of effort to provide services for teachers, but you know
5 that your state declared that all the children in that
6 school were eligible for victim/witness, but they didn't
7 make the teachers eligible or the school staff. I found
8 that -- having worked with victim/witness that comes to the
9 school the first day and registers everybody, that that was
10 almost at first telling them that they weren't victims of
11 the crime. Although you've made major efforts to actually
12 provide services for teachers and resources, they were
13 victims of a crime, no matter where they were and whatever
14 efforts they made, the school staff, to protect their
15 children, and they need their own dedicated program. And
16 that's all the staff members, not just the teachers, the bus
17 drivers, the nurses, the staff -- imagine the demands on the
18 secretaries at the front desk and the protection that they
19 provide every day, people coming into the school. They buzz
20 them into school. So, they need their own assistance.
21 They're dealing with reminders in ways that all of us in our
22 daily lives really can't almost comprehend.

23 We've also learned to institute far ahead of time
24 special systems of support to those most affected at the
25 anniversaries, including efforts in high schools where we've

1 dealt with community -- school violence that, actually, in
2 terms of suicide and substance abuse prevention at the time
3 of the anniversary, organized whole high schools to
4 support -- screen for and support every child with a
5 suicidal ideation in that high school, dependent on the
6 school violence that they experienced. And independent of
7 that, to stabilize that school, that high school at that
8 point, and that's a very systematic effort.

9 We've also learned to be very systematic about the
10 range of reminders in that -- for schools to keep an
11 inventory, to have a vocabulary, to keep building that, and
12 build-up the skills individually and in groups of children,
13 of school personnel, among parents and children, to help
14 them manage them as a recovery -- as a key to the recovery
15 over time. We have studies about this. We worked in
16 Beslan, so we know from there how reminders affected that
17 school community so effected by a horrific terrorist attack.

18 And in a relatively small community like Newtown,
19 a more district-wide approach is needed to identify and
20 support youth and school personnel who have a personal
21 relationship to children and staff who died. We know from
22 speaking -- we have teachers that have taught at the
23 elementary school and have gone on to intermediate school,
24 and they're very -- had friends, I mean, they knew. They
25 have children who were coaches, babysitters, other things.

1 So, it's -- in a small town, you need to be able to reach
2 out much more widely into the school that was seniorly
3 effected.

4 And further, we have consistently found that it's
5 a mistake to overlook that there are many other children and
6 youth who have experienced other forms of trauma and loss
7 that should not be overlooked and deserve renewed attention
8 indicated by proper screening. So, you can't just go in and
9 focus on the trauma. There are lots of children with trauma
10 and loss issues. There are other problems. They feel kind
11 of left out and not attended to. You need to renew your
12 attention. You can actually do some really good work with
13 them, and you can do that systematically afterwards. And
14 then you have to set up an approach, as Newtown is planning
15 to do, to see the emerging mental health problems and to
16 make sure that you identify and provide services. That's
17 the way to really stabilize a school community in a school
18 district like Newtown at this point.

19 Let me just change a little to the studies of
20 communities after major disasters have also indicated that
21 the combinations after major disasters, outside external
22 event, that what happens, the combination of adult traumatic
23 stress and subsequent adversities like unemployment that can
24 occur, generates an increase in family violence and
25 substance abuse.

1 So that violence in the families, as you're going
2 to hear a little later, remains the primary source of
3 traumatic experiences for young children and with neglect,
4 abuse and witnessing domestic violence often occurring
5 together.

6 And you're going to hear from Dr. Ford, I think,
7 about how that and additional victimizations, sexual abuse,
8 community violence, other trauma and loss actually generates
9 kind of a caravan of risks so that by the time you get to
10 adolescence, you have serious mental health and health risk
11 and adverse outcomes for adolescent functioning in the
12 transition to young adulthood, and I'd say to the overall
13 mission of this Commission, to good citizenship.

14 I know that Marleen Wong referenced Dean
15 Kilpatrick and his colleagues seminal work relating exposure
16 to violence and chronic PTSD among adolescents, the high
17 risk behaviors, including substance abuse, academic failure
18 and gang activity. I think she showed you a slide about
19 that.

20 Through two other findings, I'd like to illustrate
21 the powerful role that exposure to violence and traumatic
22 stress plays more generally in the field of child mental
23 health.

24 This, in the next slide, are from the National
25 Comorbidity Survey Replication Study. That's a

1 representative sample of the U.S. Population that looked at
2 mental health disorders with face-to-face interviews, really
3 well done, and Dr. Putnam -- Drs. Putnam, Harris and Putnam
4 use this information to examine the effects of physical
5 abuse, sexual abuse and poverty on mental health outcomes.

6 Now, in a normal -- as they explained, in a normal
7 odds ratio, which is the chance of having something happen
8 to you, having a condition or not having it, which would not
9 be one, it's an equal risk. If you reach an area that you
10 have 30 percent more chance at 1.3, that's considered in
11 America a public health issue. So, if you can -- if high
12 blood pressure -- by reducing blood pressure can reduce the
13 risks of a stoke at the level of 1.3 down to one, we make a
14 whole public health effort in the United States.

15 I want you to look at these. These are attention
16 deficit, alcohol dependence, conduct disorder, drug
17 addiction, explosive personality, major depression and PTSD.
18 They're up at the five levels, four and five levels. That's
19 like an astounding public health issue when you start
20 thinking about what exposure to physical and sexual abuse
21 means in mental health emanating from traumatic stress.

22 It's the same true for boys, but I also want to
23 move on to a second study, and which is -- let's look at a
24 specific disorder. That's talking about traumatic stress
25 and its outcome. Let's look at its effect on a bipolar

1 youth in the country. I'd make two overriding
2 recommendations to you. First, that on its own, child
3 traumatic stress is serious and needs dedicated attention of
4 all our child-servicing systems including early screening
5 for the types of exposures that make them -- put them at
6 risk.

7 Second, that child traumatic stress is a
8 cross-cutting issue in all of health and mental health; and
9 therefore, must be a part of the policy discussion in regard
10 to all integrated health and mental health care. And you're
11 going to hear more about the Attorney General's national
12 task force on children exposed to violence and their
13 recommendations, Dr. Marans is a member, but we would,
14 obviously, endorse those as well.

15 I just want to tell you for the last couple of
16 minutes, just spend three or four minutes on the National
17 Child Traumatic Stress Network. This is a curious
18 legislation. It was a legislation passed in 2000. It got
19 passed in 2000, but it got put into place the day of
20 September 11th. It was being reviewed that day. It is
21 named after Donald J. Cohen, who was a -- the Chair/Head of
22 the Yale Child Study Center. Imagine, it's the only mental
23 health program ever named after a child psychiatrist, and we
24 feel honored that it's -- so it's here in the state and it's
25 at Yale and it's part of his legacy that we all share. But

1 illness, very common disorder in the United states. It has
2 one of the highest rates of mortality of any psychiatric
3 disorder. But if you -- this is from an international study
4 done to look for the first time some years ago about the
5 effects of the frequency of child and physical/sexual abuse
6 on adults, retrospective study, on their rates of suicide
7 attempts. It raised the risk of suicide attempts in people
8 with well diagnosed bipolar illness by three times from like
9 25 percent to 60 or 70 percent. That's an outstanding --
10 it's alarming. And yet that doesn't mean that this is paid
11 attention to in the care of other people with major mental
12 health disorders, but it indicates that it is.

13 So that, you know, we know from our -- from our
14 work with more than 14,000 children, the data on them that
15 we've seen through our National Network that indicates that
16 suicide behavior in adolescence is often associated the
17 cumulation of traumatic exposures in the lives of children
18 and youth.

19 So, that means to this Commission that no
20 discussion of suicide prevention including, I would say, in
21 this case, murder/suicide -- I've studied a lot
22 murder/suicide -- can take place without consideration of
23 traumatic stress.

24 And as this Commission takes up two critical --
25 the critical questions regarding mental health care of our

1 in it, it said that we were directed to actually increase
2 the standard of care and increase access for children and
3 families across the United states. That's in the
4 legislation that came out of Congress. Standard of care
5 made us have to look at quality care and evidence to improve
6 quality of care.

7 It has a broad mission. It means developing and
8 adapting evidence-based treatments and interventions,
9 training at all levels and multiple formats. It means that
10 by training, we do both intervention training and advancing
11 the skills as you're going to hear about, doing good care,
12 but it means that we also work on all the trauma services,
13 all the child-servicing systems where children appear; child
14 welfare, juvenile justice, health care, schools. All of
15 them have to have a mind to understand what happens and how
16 to identify and respond to children who have had trauma and
17 serious loss. So, we work in all those formats. We need to
18 have major development or dissemination of our trauma
19 resources, partnership with government, private and public
20 organizations, and we're funded by Congress. We feel an
21 enormous sense of accountability to the public about how we
22 spend our dollars and what we do and try to provide real
23 accountability in measurable ways for our nation.

24 We work in all child-servicing systems. The last
25 says we're part of an effort to modernize child disaster

1 mental health, and we've been fortunate and privileged to be
2 able to work with the Newtown School District to help with
3 their Project Serve, to provide it -- being advisors as part
4 of what we see as a national effort to really modernize
5 disaster child mental health.

6 And this just shows you our centers across --
7 there are now 78 centers across the United States; academic
8 centers and community service sites, all that are combined
9 in a collaborative way. We have affiliate members who have
10 been members before who actually continue to participate so
11 the influence across the states, the United States, are
12 really quite wide and provide much more expertise.

13 And then, you know, I don't think I need to go
14 into more detail except that I think the last some point is
15 that we look on ourselves and hope to be beneficial to all
16 of you as a national resource. All of those sites, all of
17 people working together, all of the materials that are
18 products that are done, all our educational curriculums, all
19 the new platforms that we have developed to enhance the
20 training and evidence-based treatments we see as our goal to
21 provide a national resource that can be used by communities,
22 schools, families across the United States. Thank you.

23 CHAIRMAN JACKSON: Thank you, Dr. Pynoos. Do we
24 have any questions or comments? We are going to go into
25 some other discussions that may clarify some issues.

1 roles as defined by profession often rather than being
2 defined by the phenomenology of the impact of events on
3 individuals, families and entire communities.

4 The short answer is that there are models out
5 there for thinking along different lines. Some of them have
6 been actually brought to bear here in Connecticut,
7 especially post 9/11. I'm looking at Dr. Ford because we
8 worked very closely together in thinking about preparation
9 and response, but -- so that the simple answer is the models
10 are there, but I think there does need to be, as we've been
11 talking over many years, both at the federal, state and
12 local levels, that coordination is easier said than done.
13 But the models do exist, and there's a opportunity to take
14 advantage of what we've learned.

15 DR. ROBERT PYNOOS: And, you know, it doesn't
16 answer the full question, but you have four sites, four
17 centers, within Connecticut that can immediately -- who have
18 been part of our disaster response, sort of, network, and
19 they could look to coordinate and be available with really
20 well-trained people in a lot different, other issues
21 regarding that stratification and start to work out how to
22 do things and who can participate in helping the school
23 district develop their Project Serve grant so it started to
24 meet the varying stratified needs, that's not as immediate
25 as sometimes people would like, but it is to develop the

1 Dr. Schwartz.

2 COMMISSIONER SCHWARTZ: So, one issue I think I'm
3 not sure of, and I possibly missed a session in which it was
4 discussed, but with regard to the bullet on the training and
5 availability of members to respond to events, can you, or
6 perhaps some other member of the Panel who's speaking today,
7 review the various resources that are turned to in general
8 and that were turned to around Sandy Hook.

9 DR. STEVE MARANS: I'm happy to respond before
10 giving my remarks. Number one, there is a great deal of
11 experience that's built up over the last 20, 30 years in
12 terms of coordinated responses, and I'll say more about why
13 the coordination of various responses, not just from mental
14 health but across the critical incident response, are so
15 essential to stabilization and recovery.

16 I would add that, you know, the -- what we've
17 learned over the last 22 years in our work in Connecticut
18 and responding to daily events of traumatic violence and
19 other catastrophic events as well as around the country in
20 response to school shootings, et cetera, national disasters,
21 natural disasters, man-made, 9/11 attacks, is that the worst
22 time to begin new collaborations is in the middle of a
23 crisis and that we tend to operate, understandably, in
24 siloed approaches, and this includes typical approaches to
25 incident command structure. We tend to think about our

1 resources that can sustain something over time.

2 So, I think, you know, in terms of our network, we
3 have people trained, and I'm going to show you, we have a --
4 Buddy is the name, but Psychological First Aid For Schools,
5 this, actually, was available and helpful at the beginning,
6 maybe not as much because people weren't as fully trained on
7 it. We're starting to train -- this was developed by
8 probably 10 or 12 of the people with the most experience in
9 the United States in doing really serious responses to
10 disasters and violence with really, I think, good
11 step-by-step recommendations. But schools need to be
12 trained much more fully on those kinds of things, but they
13 need to have the coordinated structure that you're hearing
14 that can be provided and within the community.

15 We've learned -- I know it doesn't sound quite
16 fulfilling, but we've learned as a network how to help in a
17 crisis, but how to help to unify the response that leads to
18 a sustained package of interventions over time, and I think
19 our network really is a very strong resource for that, so
20 that all of the stratified levels of care are actually
21 available through our network. We know what to do for the
22 general study body, let's say. We know what to do in a
23 classroom for the generally affected groups. We know how to
24 help with the most highly affected children and the school
25 personnel, and we have experts in those types of

1 interventions that are available to really consult and to
2 integrate that approach as a package. That really wasn't
3 available until our network. Yep?

4 COMMISSIONER FORRESTER: Just to get concrete, I
5 think also Dr. Franks will be listing all of the resources
6 that are actually in Connecticut. And for your information,
7 Dr. Marans of the Yale Child Study Center, Clifford Beers
8 Clinic, are currently in the new Sandy Hook School. We have
9 four clinicians that are there full time. And Wellmore,
10 which is a Waterbury Child Guidance Clinic, that's not a
11 NCTSN site but has trained in many of the new models through
12 Dr. Franks at CHDI, and Newtown Youth & Family Services are
13 taking the district-wide response to this school. So,
14 currently, two NCTSN sites are in the new Sandy Hook School.

15 COMMISSIONER JACKSON: Question from Mr. Sandford.

16 MR. SANDFORD: My thoughts are this is exciting to
17 hear that we have this here in Connecticut. What efforts
18 are being made to bring this out to the principals that are
19 on the front line, let's say, in a non Sandy Hook scenario,
20 you know? What do you do to reach out to the schools in New
21 Haven, Hartford, Bridgeport or North Grosvenor Dale so that
22 they know that this is there and they can turn a knob when
23 they need it?

24 DR. ROBERT PYNOOS: Thank you for that. You know,
25 we have, as a national resource, a very large school

1 national need, and we need to strengthen that anti-mental
2 health bill in Congress right now to restore more of the
3 monies to the Safe School Program, restore money to Project
4 Serve to do more training like on our -- ours and others
5 Psychological First Aid For School. There are a lot of
6 instructions in here for principals and how to manage the
7 decision-making. We think that that is an exceedingly
8 important agenda.

9 DR. STEVEN MARANS: I would just like to add that,
10 you know, again, going back to silos that you mentioned,
11 some of the cities that you mentioned, and it's often --
12 there is so much activity that has gone on that serves as a
13 basis for more integrated responses, and that's about -- as
14 you suggest, not just in times of crisis. The work of
15 Dr. James Komer over the last, you know, 35 years has been
16 both -- and in Connecticut, and it's expended throughout the
17 country in terms of building and strengthening school
18 communities so that these -- that school communities are
19 better prepared when terrible things happen. The work of
20 Clifford Beers in the New Haven Schools is another example
21 of the work of school-based clinics, et cetera. So, you
22 know, this is, again, about being able to actually identify
23 existing resources, capitalize on existing resources, and
24 strengthen and then support them.

25 DR. ROBERT PYNOOS: In Connecticut, the Department

1 collaborative task force that works primarily in schools,
2 works with principals, works with administrations, works
3 with the teacher unions, the large ones, to try to make
4 schools much more available in terms of understanding --
5 much more knowledgeable in terms of resources. I'm glad you
6 meant principals. I mean, this is -- Newtown was -- because
7 the leaders of the school were killed, it's horrifically
8 more difficult. When we do our work at schools -- I can
9 tell you the high schools, Santana, Springfield,
10 Columbine -- our principal work to begin with is with the
11 principals. It isn't actually with the children and youth
12 at times because the principal makes or breaks the long-term
13 sustainable program, and we know how to support principals
14 to do that.

15 We did -- I've been around this too long. We did
16 a film back in the 1980s with the Department of Education in
17 which we gathered principals from 10 or 12 schools where
18 there had been school shootings, and we did a round table
19 with them, actually filmed it, actually made a video that
20 was available to make other principals available of the more
21 limited resources that we knew about then than now. And so
22 we know that that's the key. So, we would -- our sites
23 here, I'm sure, have their own coordinated effort to do that
24 outreach. You have unbelievable sites here in Connecticut
25 along with their partners. So, we think that that is a

1 of Mental Health has applied to SAMHSA for funds to train
2 more widely than some of those early interventions and
3 psychological first aid for the whole state.

4 COMMISSIONER SANDFORD: My son is a principal.
5 I'm going ask him tomorrow if he knows about this stuff. I
6 don't know if he's watching television, he'll get ready. I
7 guess my concern is that this sounds like it's -- you know,
8 from being a firefighter, this is extremely important
9 information that local school principals need to know. So,
10 I guess what I go back to, Mr. Chairman, is maybe this is
11 another one of those things that we need to put on the shelf
12 to look at in the future, is going to the Connecticut
13 Educational System and saying, you know, to become a
14 principal, you need to be certified. You need to have
15 certain credentials. Maybe this needs to be included in
16 that educational system for principals so that they get an
17 understanding what's out there so that they're not meeting
18 you for the first time. I couldn't agree more with your
19 statement that you don't want to meet someone during the
20 disaster.

21 DR. STEVEN MARANS: And I hope that some of the
22 recommendations that I'll bring from the U.S. Attorney
23 General's task force will also resonate with your point.

24 COMMISSIONER LYDDY: Thank you, and good
25 afternoon. It's remarkable to see such incredible people

1 here to offer us some support in our work in trying to
 2 figure out what we're doing and where we're going. I have
 3 two questions, and looking kind of 10,000 feet above what
 4 we're doing here today, there must be some coordination or a
 5 place for districts to go to say how do we coordinate the
 6 services, where does that funding come from, and who do we
 7 rely on for support to get that. Can you describe the
 8 process and perhaps what type of grant or funding is
 9 available for districts?

10 DR. ROBERT PYNOOS: Well, I think that one of the
 11 recommendations here should be to reinforce that the
 12 Department of Education where some of that is rested, the
 13 Federal Department of Education, has had funds removed and
 14 resources depleted so that doing it here in Newtown was
 15 actually, to my mind, more difficult and not as
 16 straightforward as might have happened, sadly, in other
 17 tragedies a few years ago. And it's taken kind of
 18 recreating some of that kind of expert consultation that the
 19 Department of Ed. would bring together very quickly to reach
 20 out and help the school district immediately. Because of
 21 our sites here, because of the -- some of the expertise like
 22 Dr. Brimer, Marleen Wong, others, that we could kind of
 23 recreate that, but I will tell you for many years that came
 24 much more coordinated from the Federal Government. Reaching
 25 out to that level of resources and having them immediately

1 have things like FEMA just to -- that have funding and then
 2 through SAMHSA to respond to disasters.

3 But the way Congress had decided some years for
 4 school violence was to have, through the Department of
 5 Education, Project Serve Grants that could be applied for
 6 and used when there's school violence or sometimes other
 7 events at school, and that can be for -- not always the
 8 first days, but it's designed to start to fill in within a
 9 few weeks and months, and it has different stages so you can
 10 get that kind of early intermediate care, and then plan
 11 long-term. It has to be actually applied for. It's a
 12 very -- it's a real rigorous -- this is federal dollars, so
 13 they want to know who's been affected, how seriously they've
 14 been affected, what other problems that the school is facing
 15 even immediately, what are the kinds of plans and detail
 16 that you want to do, how do you want to hire staff and what
 17 their purposes is. It is a real application.

18 So, the school, in the middle of this, actually
 19 has to put together critical information. Newtown was able
 20 to -- you know, how many kids in a high school, how many
 21 kids stopped going to school the next day after a school
 22 violent event. I mean, lots of truancy and absenteeism.
 23 You need to pull that data together. You need to pull
 24 together how many kids were exposed and to what, how many
 25 school personnel, how it's affected other schools. You need

1 available to be able to do that kind of assistance to school
 2 districts doesn't match the issue that Dr. Marans said about
 3 their preparing beforehand so districts are able to have
 4 their -- you know, unified as its crisis teams that have all
 5 worked together, practice, can share across schools, all
 6 that done ahead of time. So, all of that is very important,
 7 but it is important for the part of the Federal Government
 8 that can help support the kind of services that are needed,
 9 or whether it's at the state level, to have that resource,
 10 coordinated resource, there working already and available to
 11 be there, and that's taken a little more recreation here
 12 than would have been true a few years ago, but that's --
 13 that can be with additional resources really put back into
 14 place as strongly as it has been.

15 COMMISSIONER LYDDY: That's a great
 16 recommendation. And you did mention earlier the Project
 17 Serve Grant. Could you just explain what that process looks
 18 like? I understand you probably can't get into details
 19 right now about the content, but the process, I think, is
 20 important moving forward for -- if we're going to make
 21 recommendation that that's a tool that districts can use.

22 DR. ROBERT PYNOOS: I think that -- I'm sorry
 23 because I didn't try to repeat what Dr. Wong had presented,
 24 a slide on Project Serve and what it does and how it's
 25 funded through the Department of Education. You know, you

1 -- Newtown had to pull all that kind of information together
 2 in the middle of everything else they were doing in order to
 3 provide -- in order to apply for the federal funding.

4 You can't fault the Federal Government, they
 5 want -- and then they negotiate with you over what they
 6 think is legitimate, what they think they need more evidence
 7 for, and in this case, the support, what was being asked for
 8 in Newtown -- I can say this more generally -- was for a
 9 more multi-year program in which the intermediate and
 10 long-term were not necessarily fused but more flowed into
 11 each other because of the nature of the elementary school
 12 and how it was affected and what it means for Newtown.
 13 Those had to be wrapped. They had to be given good
 14 justification. And so, you know, the school needs
 15 resources. This is not the type of grant that they had ever
 16 expected to have to write and, hopefully, schools will never
 17 have to write, but they needed resources.

18 So, there are -- again, the Department of Ed. used
 19 to be able to provide some more sources. You had Marleen
 20 Wong helping, Dr. Brimer helping, who have written those
 21 before, who have done those before. Someone like myself
 22 whose been around that and could help with the understanding
 23 by interviewing and going through the whole school
 24 community, everybody involved, nurses, teachers, bus
 25 drivers, parents and school psychologists, all the staff,

1 what they would like to see and for what reasons so that
 2 that could be -- have a voice in this type of grant. All
 3 that hard work was done in order to submit this grant, but
 4 just imagine the -- and everybody, I will tell you, in
 5 Newtown, I can just say, was unbelievably engaging with
 6 that. They understood the importance. They understood some
 7 of the delay. They wanted to see the resources. They want
 8 them well targeted for the kind of outcomes that they're
 9 looking for. But that's the kind of process that you go
 10 through, and it's very hard on a school community without --
 11 we would hope that a national center is a network within our
 12 sites -- to have enough experience that the Department of
 13 Ed. can call on us to be able to help schools at that time
 14 and to be able to provide the additional resources they need
 15 to think through and to help them actually with the grant
 16 itself.

17 COMMISSIONER LYDDY: Just a few more questions.
 18 Do you know when this Commission might be able to see that
 19 grant because, for the edification of this Commission moving
 20 forward, I think what comes from that grant are probably
 21 going to be a lot of great lessons learned, that we can, in
 22 our recommendations, perhaps, make sure we highlight because
 23 of the good work that you're doing. So, you know, as we
 24 progress, can you give us some idea as to when we'll be able
 25 to see that?

1 DR. ROBERT PYNOOS: I don't think -- I personally
 2 don't actually have that information. The Department of
 3 Education has handled this in a confidential way in the
 4 negotiation of the school district, so they didn't want
 5 things to get -- I would guess, more than anything, made
 6 public until everything was finalized. They do negotiations
 7 with the school district over what's being asked for. I
 8 don't know when that is all finalized. I think at the point
 9 that that's finalized, it's public. It's public. It should
 10 be not only available to the Commission, but it should be
 11 available for the public to take a look at and see what's
 12 being funded in some way. I mean, that's appropriate. This
 13 is federally-funded assistance, so -- but I think during
 14 that part, they would like to be able to -- it's happened in
 15 many school districts -- to be able to talk directly to the
 16 school district and figure out the fine tuning of what that
 17 is before they release it more publicly. But I think you
 18 would need to speak to both the Department of Education
 19 federally and to your own Newtown School District about when
 20 that moment might be.

21 COMMISSIONER LYDDY: Thank you very much.
 22 CHAIRMAN JACKSON: One question, Dr. Pynoos. Now,
 23 you mentioned that -- you mentioned that child trauma is a
 24 cross-cutting issue, and as such, screening for trauma or
 25 grief-related items is critical in terms of moving into

1 appropriate treatment or recovery efforts thereafter. I
 2 know that the pediatrician who serves my children is
 3 diligent about asking those types of appropriate questions
 4 and quite unafraid in doing it. I am not sure what your
 5 experience is, if that is common. There is also another
 6 place of congregation for young people, which is in the
 7 school. So, I'm wondering if you have a methodology, either
 8 at the level of pediatrician or at the level of the school,
 9 to sensitively approach this conflict.

10 DR. ROBERT PYNOOS: I think in the combined
 11 expertise of our groups here, but more widely, we know how
 12 to screen. We know how to ask questions in schools. But
 13 you're right, it's very unevenly approached even in the
 14 adult word and adult health care. It's -- even where it's
 15 been demonstrated to have really significant effects on
 16 cardiac disease, on cancer. I mean, things you wouldn't
 17 necessarily expect that they're not properly screened.

18 I was just at a meeting this morning with somebody
 19 who said with all those studies, it's just hard to get other
 20 professionals to screen appropriately. But Headstart -- I
 21 mean, I've done work after the civil unrest in Los Angeles.
 22 We actually screened for the more immediate issues in the
 23 family and otherwise. Headstart can meet that. Preschools,
 24 I think that Alice Forrester can speak to that. A good
 25 place to start -- I mean, there are dog bites, burns, near

1 drownings, things that really do have effects, measurable
 2 effects, on children. There are serious -- along with the
 3 negligent and abuse and other things that can occur.

4 High schools -- we worked in a -- in high schools,
 5 and so has Marleen Wong, where we screen the entire high
 6 school, and we -- it's not hard to do, actually -- and you
 7 know what we've found in places like Los Angeles, high
 8 schools where they had alternate school classrooms where
 9 kids were having problems were -- well, guess what, you
 10 screen the whole high school. And who has the most
 11 concentrated exposures to trauma and traumatic deaths and
 12 other things and some of the highest levels of posttraumatic
 13 stress were kids in the alternate school classes. And I
 14 will tell you the high school had no idea. They had no idea
 15 that that was what was happening. Same thing as she pointed
 16 out with absenteeism and school failure.

17 So, it is a national issue to be able to
 18 appropriately ask questions. You're not always going to get
 19 full answers. But I will tell you, you get much more
 20 answers than you think. It's like we've learned to ask
 21 adolescents on computers to give answers to mental health
 22 questions, and they'll tell you. I mean, I've worked with
 23 murder/suicides at schools and here and shooting of peers
 24 and family members. And it's hard to ask about, let's say,
 25 homicide. I mean, you had a whole thing about risk

1 identification from homicide. But many of them are
2 murder/suicides, not all. If you ask an adolescent about
3 being suicidal, even confidentially on a computer screen,
4 they'll answer that. Now -- but they aren't asked. And I
5 will tell you the number of school incidents beforehand,
6 that question wasn't being asked. They might have admitted
7 to the homicide, but they wouldn't have admitted to the
8 suicidal issues, and you could have identified them.

9 So, I think that -- you know, we did -- at Santana
10 High School, we screened the entire high school for suicidal
11 thought two or three months before the anniversary. The
12 whole high school. We identified 68 individuals -- Dr.
13 Brimer did -- who had suicidal thoughts. They were paired
14 up with peer support, teacher support, making sure there
15 were treatments because a number of them were in treatment,
16 were supported, and they went through that anniversary and I
17 -- and many of the high school anniversary times after
18 school violence have had suicides time and time again. But
19 that was a very concerted high school approach to a very
20 important issue. But, you know, schools can do that. They
21 just do not see themselves moving into a mental health
22 clinic in their own eyes, but it's part in parcel of the
23 school functioning, we think, at this point.

24 DR. JULIAN FORD: And if I could just add briefly,
25 I'll be covering some current efforts that are ongoing in

1 not form new collaborations in the middle of a crisis;
2 however, it, hopefully, can become a model for moving beyond
3 just the collaboration that occurs around specific, more
4 narrowly defined mental health intervention approaches.

5 I am reminded -- and I am also delighted that
6 actually some of our colleagues from Clifford Beers who are
7 working in the schools are here with us today. I am
8 reminded of a story, and I promise it will be a brief one,
9 but it's -- to me, it's a good one. I learned a lot from
10 it. I was a young clinician a long, long time ago, and I
11 was working with a five/six-year-old boy who had been
12 severely traumatized. I'm not going into details, for
13 obvious reasons, but I got to this point where I didn't know
14 which time I had been kicked or spat at or chased him around
15 a clinic, but I was consulting with a senior colleague of
16 mine, a pediatrician, child psychoanalyst, her name was
17 Dr. Sally Provinson. I went in and I was feeling quite
18 despairing, and I really was despairing of my own abilities,
19 my own competence, and I was also despairing about this
20 boy's future and his ability to recover from the terrible
21 experiences that he and his family had had to go through.
22 And she said something that's always stuck in my mind which
23 is really the, sort of, background to what I'd like to
24 present today. She said, you know -- first of all, she
25 helped me think technically about what to do differently, et

1 Connecticut to screen children in various systems, including
2 pediatrics, so I'll be covering that in my presentation.

3 COMMISSIONER JACKSON: Any other questions? It
4 looks like we're ready to move on to Dr. Marans, just in
5 time.

6 DR. STEVE MARANS: So, first of all, as a citizen
7 of Connecticut, I want to thank the Commission for your
8 service to the state and I really mean that. And in many
9 ways, it's reflective of one of the major experiences that
10 I've had, my team and colleagues have had, is that in the
11 wake of such a terrible tragedy that the extent to which
12 people have stepped up and responded has been really quite
13 extraordinary.

14 I'm also really pleased and actually quite
15 delighted to be able to be with colleagues with whom I've
16 worked for many, many years and learned from for many, many
17 years. As Dr. Forrester mentioned, our agencies, along with
18 our colleagues from UConn and CHDI have been involved
19 from -- within moments of the terrible events of
20 December 14th and have worked tirelessly and currently are
21 involved in Sandy Hook Elementary School.

22 I am so enormously grateful not only to members of
23 the Yale Child Study Center, Trauma Section, our colleagues
24 at Clifford Beers, our colleges at the National Center
25 because it, in fact, is an example of having the capacity to

1 cetera. But she said, you know, if out of a tragedy, we're
2 able to learn just one thing that helps the next family, the
3 next community, the next situation, then it is not only a
4 tragedy. I strongly believe that in the last 22 years, our
5 work has been involved, as I said before, with dealing with
6 tragedies and horrific incidents that have produced
7 traumatic experiences in individuals, families and
8 communities and nations. And that idea that we have
9 something new to learn in order to move forward is what has
10 sustained not only my work, but many of my colleagues' work,
11 and I'm grateful to all of them who have taught me, but
12 especially to the kids and families who have been our best
13 teachers, all of us.

14 Next, please. So, I don't want to go into detail,
15 and I promise I'm not going to burden us with the actual
16 enormity because if we -- we have an opportunity here, which
17 is to think broadly, as the questions from the Commission
18 have already suggested, to think broadly about what do we
19 learn from childhood trauma and terrible mass casualty
20 events as a way of mapping on to how do we think better
21 about serving our children, our families and our
22 communities, and -- but it's a daunting task.

23 If you look at the exposure rates to violence that
24 is based on a study done by David Finkelhor and the
25 Department of Justice a few years back, the numbers are

1 really quite extraordinary in terms of the sheer numbers of
 2 kids who have been exposed to potentially traumatic events.
 3 Bob has covered some of things, and I don't want to belabor
 4 them, but I want to not just set us up for a sense of
 5 failure and impossibility, but then to move into what we
 6 know about some of the things that we can do.

7 Next. These figures are extraordinary to me, just
 8 in terms of numbers, in terms of the domestic violence.
 9 They're a real underrepresentation. But when we start
 10 looking at the consequences and we look at the repeated
 11 victimization, which I know Dr. Ford is going to talk about,
 12 we are then not surprised that the cyclical nature of, for
 13 example, interpersonal violence is so clear, the
 14 intergenerational transmission based on the experience of
 15 being a passive victim to the people we rely upon and love
 16 the most doing damage to one another.

17 Next. We -- and Dr. Pynoos was referring to
 18 Dr. Vincent Colletti's study along with the Centers for
 19 Disease Control about the effects not only on psychiatric
 20 difficulties but also on general health outcomes.

21 Next. Again, one of the things that -- going back
 22 to the issue of silos that we -- when we don't go far enough
 23 upstream, we spend, you know, billions and billions of
 24 dollars in this country -- again, Dr. Ford will be talking
 25 about this -- on outcomes in terms of our criminal justice

1 responses in the acute phase, in the early days, weeks and
 2 sometimes a few months following a potentially traumatic
 3 event. And when -- part of what we've been doing in the
 4 schools have been meeting with parents and teachers and kids
 5 and talking about normal responses, but normal doesn't mean
 6 nice.

7 We also know -- next -- that the longer term
 8 impact of unrecognized, untreated trauma really have
 9 life-long implications, as Dr. Pynoos has pointed out. And
 10 we also know that some of the more powerful -- the early
 11 symptoms are that, in addition to other factors, can predict
 12 some of these more serious long-term outcomes if they are
 13 not addressed.

14 Next. Again, we really need to be careful about
 15 thinking about what are some of the factors that we've
 16 learned about that predict good and bad outcomes. And
 17 again, what I've been so impressed by -- I know my
 18 colleagues have been so impressed by -- is that Newtown has
 19 the great fortune of not having to be challenged by many of
 20 the factors that too many of our young people, too many of
 21 our families, too many of our communities confront well
 22 before an acute episode of violent traumatization. And I
 23 say this to families and parent groups in Newtown as well.
 24 And I am so proud to be witness and feel so fortunate to be
 25 witness to the great strength that has been shown, and

1 system, et cetera. But we know a great deal about further
 2 upstream where these perpetrators of violent crimes, either
 3 in their neighbors or in their homes, what lies behind it.

4 Next. We know about the links between sexual
 5 abuse and drug abuse and depression and the like. And
 6 again, I add the dollars and cents because part of your task
 7 as a Commission is to think about how do we shift the
 8 paradigm in thinking about what we're doing not as an
 9 addition in lean times economically, but actually as a much
 10 more cost-effective approach to dealing with a broad array
 11 of issues that have a common denominator of unrecognized,
 12 untreated childhood trauma.

13 Next. Dr. Pynoos has already done his usual
 14 masterful job in really laying -- setting the framework for
 15 thinking about what do we really mean when we talk about
 16 trauma. It's an overused word, by the way. There's a great
 17 difference between the upset that we, as a nation, feel in
 18 the wake of overwhelming events, such as the one that
 19 occurred in Newtown, and the real traumatization that has
 20 implications for the way our brains and our minds actually
 21 operate that where our body respond, and as Dr. Pynoos
 22 pointed out, the level of vulnerability and the challenges
 23 to recovery that that kind of dysregulation, the traumatic
 24 dysregulation, leads to.

25 Next. You know, we often talk about normal

1 that's part of what we want to mobilize in all families, all
 2 communities. But I also want to underline that some of
 3 these are self-evident by emotional proximity, obviously,
 4 the closer the relationship to the immediate victims, the
 5 more powerful. But I want to underline this last point.
 6 The secondary impact of ongoing disruption of routines of
 7 daily life. This is critical, particularly in terms of
 8 thinking and mapping out a phase-specific response when
 9 overwhelming events effect an entire community -- next --
 10 but also individuals and families.

11 Again, many of these are self-evident. Boy, I
 12 really hope these are the right slides because I've had some
 13 of these italicized. So, I'm hoping it's just the computer.
 14 But, anyway, many of these are self-evident. And again, if
 15 we think about the specific community, we ought to be
 16 thinking about the entire state. And I understand that
 17 that's the function of this Commission.

18 I want to go to the last two items. Two of the
 19 most powerful predictors across all of our studies -- and
 20 all of our research, all of our clinical experience, I can
 21 put it in the negative or the positive. I'm going to put it
 22 in the negative. The failure to identify affected children
 23 and the failure to provide adequate family and other social
 24 supports are the best predictors of bad outcomes given other
 25 factors in terms of emotional proximity and physical

1 proximity and the like.
 2 Next. So, one of the things that we -- we take
 3 the phenomenon of what we understand to be traumatic
 4 dysregulation. We use that as a map for developing
 5 strategies to respond. And so, for example, we want to
 6 reduce the risk factors and build on protective factors. I
 7 know I'm stating the obvious but, you know, sometimes when
 8 we're overwhelmed, it's hard to see the obvious. And so we
 9 think about how do we strengthen familiar and caregiver
 10 emotional support. How do we facilitate the recovery of
 11 control.

12 And again, if the sine qua non of trauma is the
 13 loss of control, not the feeling of loss of control, the
 14 real loss of control that leads to unanticipated,
 15 overwhelming danger in which we can't flee or fight, in
 16 which there is real neurophysiologic dysregulation, the
 17 idea, given what Dr. Pynoos was describing about some of the
 18 symptoms, and some of the ones that I mentioned, we actually
 19 recognize that there is a secondary lack of control, which
 20 is over our own bodies and over our responses that interfere
 21 with a return to daily life. This is really significant
 22 because it provides a map to what do we want to do in the
 23 acute phases and beyond. We want to help kids and adults
 24 get back control of their lives and to actually, in fact,
 25 mourn what couldn't have been controlled in the first place.

1 can they be identified. And this list is not your typical
 2 list. And, in some ways, it helps to identify the other
 3 partners that need to be involved in our expanded notion of
 4 what we consider to be therapeutic, what we consider to be
 5 approaches that can support recovery.

6 Next. And again, some of these have -- Dr. Pynoos
 7 was mentioning, but, you know, it's always interesting to me
 8 when people are thinking in a more isolated way, and I'll
 9 just use mental health professions. If somebody is acutely
 10 traumatized but the danger, the situation of danger and
 11 overwhelming danger that has led to their traumatization
 12 still exists, what's the first order of business? Well,
 13 it's not to dive in to conducting therapy alone. It's to
 14 identify what are the ongoing stressors that are making
 15 recovery so difficult. And, by the way, when it comes to
 16 safety, I've worked with law enforcement for the last 22
 17 years, which has helped me to learn when I turn to my law
 18 enforcement partners and how we work together, which I'll
 19 describe briefly in a moment, about ensuring that we're
 20 looking into the safety issue.

21 Next. So, I'm going to talk very, very briefly.
 22 You have the slides, and there's more material that's
 23 available, if you like, but actually, in the face of the
 24 crack epidemic in the early '90s, both law enforcement in
 25 New Haven and colleagues at the Child Study Center recognize

1 We also want to, as part of that aim, provide the skills
 2 and -- both in short-term and intervention that I'm going to
 3 describe in a moment, and also in terms of longer term for
 4 those kids and adults who are going to need longer term care
 5 because of the difficulties in recovering.

6 And the other thing is we always want to keep in
 7 mind that we want to assess what are the ongoing external
 8 stressors, and that will vary from family to family,
 9 community to community, but one of the things that has been
 10 so notable in Newtown, as has been the case in other
 11 communities where -- that have been affected by mass
 12 casualties, is that often in the best intended wishes of
 13 people wanting to be of help, there can be an instability
 14 that is perpetuated by some of those efforts, and I'm not
 15 just talking about the media. Although I was in a meeting
 16 at Columbia on Monday in which journalists and clinicians
 17 and others were addressing what is the role of the media and
 18 how -- what is a burden on a community in the wake of such
 19 events.

20 Next. So, when we get back to the idea of the
 21 risk factor or the protected factor, then it leads us to
 22 think about, well, who are the -- where are the
 23 opportunities for identification of the kids who are
 24 suffering acutely but may recover without any help but still
 25 suffering, can throw them off, and it's beyond them, and how

1 that neither of us working on our own were putting a dent in
 2 this link between traumatization, early traumatization, and
 3 the perpetuation, failure in schools, et cetera. And this
 4 goes back to the silo thing. If people are not ready to say
 5 I don't know, it's hard to begin a collaboration. If you're
 6 not ready to be able to say I need you, I need your
 7 expertise, I need to learn from you, it's hard to find a
 8 common frame of reference that's going to inform the real
 9 work that might be needed together.

10 Again, I'm not going to go into this. This has
 11 been replicated in various places around the country, and
 12 I'm proud to say that after -- through five chiefs and many
 13 wonderful colleagues who have gone through the Child Study
 14 Center, we continue to do the work. Next. That involves
 15 training officers and the intersection between behavioral
 16 health, trauma, development, et cetera, and community
 17 policing and basic policing strategies. We have training
 18 for clinicians on basic something police procedure, and
 19 we're -- it's not just classroom. It's spending hours and
 20 hours getting to know each other, learning about what is --
 21 not only what it's like for police to do their work, but to
 22 get a different perspective on -- a different take on what
 23 we are thinking about when we think about potentially
 24 traumatic events. We have weekly multi-disciplinary
 25 meetings in which we review and look at case disposition.

1 We're also -- the Department of Children & Families is very
2 centrally involved in this.

3 And next. I'm sorry. This is just a very, very
4 brief slide. We did a study a few years back in which we do
5 follow-up visits in addition to offering clinical services
6 in the clinic. And the follow-up involves clinicians and
7 officers who have all been trained, cross-trained, going
8 back to homes in which domestic violence, serious demotic
9 violence, has occurred and going through safety planning,
10 assessing for symptomology in both kids and adults and
11 making linkages to other agencies in the community and -- as
12 well as clinical services. And what we're able to establish
13 is -- and we compared that to families that only got
14 traditional police services, 911 driven services only. What
15 we were able to demonstrate is, you know, you show this left
16 hand column, blue column, to a police administrator and they
17 say great, Marans, you're creating more work because the
18 blue column represents calls for service. And it's much
19 higher in the outreach group than it is in the traditional
20 911 driven response only. But here's the deal. They are
21 not 911 driven. This is pager driven, message driven, calls
22 to the officers who responded in the first place and to the
23 officer clinician team.

24 What you'll in the red column, the red bar
25 represents the severity of violence that was repeated. And

1 you'll see that in the outreach group, it's a third of what
2 the control group demonstrated. This was over a 12-month
3 period.

4 Next. We also saw that in the outreach group that
5 the number of children who were entering additional
6 services, both clinical and other, was double that than the
7 traditional police response only.

8 Next, please. Now, in the course of this work,
9 what we developed -- and I'll try to be very, very brief, is
10 the recognition that our first job, if we've used that map
11 of the acute response, is to help build and strengthen
12 family ties, and that means communication which means being
13 able to put into words and identify symptoms. And we
14 developed an early intervention called the Child and Family
15 Traumatic Stress Intervention, and it's currently provided
16 in clinics. It's been -- it's being used in various sites
17 around the country and elsewhere and is very much part of
18 our activities involved in the National Child Traumatic
19 Stress Network.

20 Next. And just very briefly -- I don't have to
21 repeat that. You have the slides in front of you.

22 Next. I'm respectful of my time and others. But
23 it's, again, to decrease posttraumatic stress reactions
24 because they really are not only not nice. They can be
25 immobilizing. Number two, to increase family members

1 engagement with one another in ongoing treatment where it's
2 indicated. And three, to identify the need of treatment
3 that may have never been discovered before the precipitating
4 event once these folks are identified. In a randomized
5 control trial, many of whom were referrals from our
6 colleagues in the police department but also from our
7 emergency department, et cetera.

8 Next. Next. Next. Next. Next.

9 What we were able to find is that we use the
10 control intervention that was above standard level of care
11 in terms of psychoeducation and assessment and that the
12 children and families who received CFTSI were 65 percent
13 less likely to achieve a diagnosis of PTSD than the control
14 group. Next. And 73 percent less likely to achieve a
15 diagnosis of partial PTSD which includes a broader array of
16 symptom clusters around anxiety and depression. Next.
17 Next. We have adapted this to child advocacy centers, et
18 cetera. Next. Next.

19 So, I want to say that the other thing that we
20 found -- and we are very, very big believers in
21 evidence-based treatments and evidence-based and evidence
22 informed, trauma-informed services so that our work with law
23 enforcement and child protective services is not the only
24 such collaboration. And one of the great strengths of the
25 National Child Traumatic Stress Network has been able to

1 learn from and capitalize on a whole array of new trauma
2 informed coordinated services, some of which you will hear
3 from Dr. Ford. And one of the great challenges has been
4 about how do you get the evidence-based treatment training
5 out there. And Dr. Franks will talk about some of the
6 efforts that have made the approach in the State of
7 Connecticut so enormously successful, not only in terms of
8 this early intervention, but longer term trauma-focused
9 cognitive behavioral treatment for kids and families who
10 need much more.

11 Now, I'm sorry to change hats and then stop. I
12 have a great -- it was not always pleasurable, but I learned
13 an enormous amount in my service on the U.S. Attorney
14 General's Task Force on children exposed to violence. And
15 this was a group of 13 members who worked together from a
16 variety of disciplines, backgrounds, and went around the
17 country and did hearings that was enormously instructive,
18 not only hearing from citizens, but professionals and from
19 various sectors that converge around the issue of violence
20 exposure in childhood. And I thought I'd share with you
21 some of the recommendations that came up. I've also
22 distributed the executive summary. You will thank me that I
23 did not distribute the complete summary or -- the complete
24 summary, that was wishful thinking -- the complete report.
25 But I thought I would share with you some of the ways in

1 which what we've learned were shaped, and I'm just giving
2 you some of the headlines, and I'm happy to address any
3 questions you have about specifics.

4 Next. So, one of the first issues -- and this has
5 not only implications for the identifying piece, but has
6 implications for a political piece that an informed
7 public -- not only about the problem but about the fact that
8 there are solutions -- there's nothing better to keep the
9 blinders on the public and on individuals than to continue
10 to feel overwhelmed and helpless. It's time that they not
11 only learn about the risk factors and the connections
12 between unaddressed childhood trauma, but actually that
13 we've learned a great deal and that there are there are
14 solutions that can prevent the long-term, deleterious and
15 costly outcomes.

16 Next. The idea of evidence-based trauma informed
17 principals, just to assure you that it's not just my idea,
18 but again, a reflection of how much we've learned, and we
19 have a great deal more to learn.

20 Next. Finance change by adjusting -- you may be
21 able to see it. I don't have it in front of me, but there
22 are ways of taking existing resources and tacking on, both
23 at the state level and the federal level, additions that
24 become part of requests for proposals in a whole range of
25 sectors, whether it's direct health care, child welfare,

1 education, et cetera.

2 Next. And again, the idea that children exposed
3 to violence are identified, screened and assessed, period,
4 and that we use -- and that we use those more expanded view
5 of places and people who are most likely to be able to
6 identify kids and then equip them as to how to do that.
7 Again, this has been talked about in terms of the need for
8 broad-based training. Again, we have professionals who are
9 coming out of medical training, social work training,
10 psychology training, who -- it's much better than it was,
11 but there's a long way to go in increasing the capacity
12 within our state, within our country.

13 Next. Again, I'm not going to go through all of
14 these because I'd much rather us spend some time on
15 discussion, but you get the idea that -- the idea that
16 hospital-based -- this is just one example, and we're not
17 just talking about violence, but motor vehicle accidents,
18 serious injuries, et cetera.

19 Next. Next. Next.

20 And I think Dr. Franks will be talking about a
21 practical way and the steps that he and CHDI have taken in
22 moving forward, good ideas to broader dissemination.
23 Dr. Ford will talk about this as well.

24 And again, this idea of growing and sustaining,
25 this costs money. This costs money. It's no good to simply

1 have training, but then not have the dollars that it costs,
2 in fact, to do the treatment. And I'll give a very brief
3 example. In terms of our response in Newtown immediately
4 was, with the help of Dr. Franks, Dr. Ford and others, we
5 were responding to requests. We were not knocking at the
6 door. We were responding to requests in the same way our
7 colleagues from Clifford Beers and elsewhere did. But one
8 of the things we found in the pouring in of resources was
9 there are wonderful clinicians, wonderful people who want to
10 be of help, but they didn't necessarily have the training
11 and the experience in addressing the acute phase needs or
12 the advantage of having the knowledge to offer the acute
13 phase services that might best fit the needs of the
14 community.

15 So, one of our efforts was to build capacity.
16 First with meeting with pediatricians, internal medicine,
17 general medicine people about how do you take advantage of
18 some of the wonderful screening tools that Dr. Franks and
19 his colleagues and others have developed. How do you orient
20 them to what they might be seeing, what they can offer. How
21 do you take advantage of materials that have been developed
22 within our National Child Traumatic Stress Network and give
23 someone something to hold onto, something concrete,
24 something instructive, and then to move forward with
25 providing and building a capacity of local providers, local,

1 local, local providers who are already in practice either in
2 agencies or in private practice with the tools and skills
3 and training and ongoing consultation in evidence-based
4 care.

5 Trauma focused CBT has been -- now there are 40
6 local providers who were trained about a month-and-a-half
7 ago. They are having ongoing consultation calls, and this
8 is a group that doesn't necessarily cog onto the --
9 immediately to the notion of manualized treatment, but boy,
10 have they become fans as they have seen children and
11 families improve under this more structured and
12 evidence-based approach with our colleagues with whom we
13 were working as one in the Department of Psychiatry, of
14 which I am also a part of. The National PTSD Center offered
15 to provide training for adult providers in cognitive
16 processing therapy and other evidence-based treatment. They
17 are having similar success.

18 Next. The home visiting is just -- we gave one
19 example that our colleagues at Clifford Beers and around the
20 state are involved in various home visiting. Go to where
21 people are, and even better, when you're able to go with
22 partners who can provide additional services.

23 Next. This to underline. This was not just
24 because of me. This is about hearing from law enforcement,
25 domestic violence advocates, et cetera, about the

1 alternatives to siloing our efforts is much more consistent
2 with the complexity and the needs and demands of successful
3 outcomes for the people with whom all of us have contact in
4 different ways.

5 Next. There's a lot about domestic violence and
6 co-occurrence. Dr. Pynoos referred to that. Again, it's in
7 your executive summary. I won't belabor this.

8 Next. I think when we talk about provide support
9 counseling to address the unique consequences for violence.
10 I guess I would underline that this goes back to this notion
11 of -- a broader notion of what we refer to as a critical
12 incident command structure that in most states there is a
13 bifurcation or a division between, for example, the public
14 safety needs and the public health needs and the mental
15 health needs.

16 And I think, again, you don't start this in the
17 middle of a crisis. It's like, who are you? Having spent a
18 lot of time on crime scenes, I didn't know the people I was
19 working with and I showed up and I'm the professor of
20 psychiatry from Yale. They'd say, what are you doing, you
21 know, except their language would maybe be more direct than
22 the one -- the language I'm using.

23 So, again, the notion of developing relationships
24 in which we have a shared frame of reference so that even
25 when we're talking about communication, we have an

1 opportunity to think together about behavioral health
2 responses or behavior of human beings that can inform the
3 way we communicate, the way we respond in terms of
4 post-event security, et cetera. These are things that we
5 have learned a great deal about, and we have an opportunity
6 to take advantage of.

7 Next. I added this. There are many more, but we
8 have a substantial and significant Indian population in the
9 State of Connecticut. And we heard a great deal from Tribal
10 Nations around the country, and I would encourage all of you
11 and all of us to become more familiar with the child
12 welfare, the Indian Child Welfare Act and to think very
13 carefully about the specific needs of Tribal Nations not
14 only in our own state but around the country.

15 Next. I think we have -- Dr. Ford is going to
16 talk about these issues.

17 Next. And I think Dr. Ford, you're going to talk
18 about the -- thank you.

19 Next. And there you have it. Any comments or
20 questions, I'm happy to address.

21 CHAIRMAN JACKSON: Thank you. Dr. Forrester.

22 COMMISSIONER FORRESTER: Dr. Marans, I know that
23 you've written an article a few years ago with Bill
24 Harrison, Alicia Lieberman called The Best Interests of
25 Society. Are you making that available for the Commission?

1 DR. STEVEN MARANS: Yes. I almost had lots of
2 copies, but I did bring one so it can be reprinted.

3 COMMISSIONER FORRESTER: Okay. I just want to
4 point out that I think it's a very good basic article in
5 thinking about the community's response to addressing
6 trauma, and it summarizes a lot of what you were saying in a
7 very clear way around whose job it is to recognize and
8 address the trauma that we see at such epidemic heights.

9 DR. STEVE MARANS: The only thing I'd want to add
10 is that we need to change the way we think about
11 therapeutic. I mean, you hear me say therapeutic, and you
12 think about clinical, and I think about it differently.
13 From the experiences that we've all had, which is -- it's
14 not even humility. It's just good reality testing that when
15 you're dealing with traumatic situations, all of the
16 elements that we've been talking about today, they need to
17 be addressed. And if the sine qua non of trauma is chaos
18 and disorder, then in order to restore order, we have to
19 have a frame of reference that serves as a unifying map that
20 coordinates approaches from all sectors that are necessary
21 across public safety, communication, medical resources,
22 housing, et cetera. These are all things that are critical.
23 And we know that when they are brought together, and not
24 particularly in mass casualty events, but in all events, the
25 outcomes are astoundingly different than when they don't.

1 Compare the results of the response to the Turkish
2 earthquake in the '90s when the Israeli government and
3 Turkish government worked together in the refugee camps to
4 reestablish order to that that occurred after Katrina and
5 the two years following.

6 COMMISSIONER SCHWARTZ: There are so many new --
7 Dr. Marans, there are so many new forms of therapy
8 treatments and so many claims that are made for them. Can
9 you just share with the Commission what the standard for
10 considering something evidence-based is?

11 DR. STEVE MARANS: Right. Well, it's a great
12 question, and it's one of the ones that we often are
13 addressing these days with parent groups with whom we're
14 working. The best treatments -- first of all, the best
15 treatments -- all treatments have, as a basis, a solid and
16 genuine connection between two or more people. And I know
17 that sounds obvious, but it's really, really critical.
18 Evidence-based really refers to -- and there's actually a
19 whole structure that has been devised within the scientific
20 community and within the Federal Government in terms of
21 registries of evidence-based treatments. And while I think
22 we have a long ways to go, there are treatments that have
23 established some pretty solid footing to suggest as our --
24 our randomizing control trials suggest, that there are very
25 good, strong predictors that with these elements of

1 treatment, there is a better likelihood of improvement,
2 recovery, symptom reduction, et cetera, than those treatment
3 approaches that don't.

4 We've addressed families who have said, well, I'm
5 in this type of treatment. Do you use that? And we say,
6 well, no, we don't. And, of course, then they get concerned
7 that maybe they're in the wrong treatment, et cetera. But
8 there are those treatments that have been developed over the
9 last 10, 20 years that have a stronger evidence base than
10 others.

11 DR. ROBERT PYNOOS: Can I just add? The National
12 Child Traumatic Stress Network, the web page in our content,
13 we actually have facts sheets on the most well-established
14 treatments, on the most promising practices. They describe
15 what the evidence base is, the different cultural
16 adaptations or uses they've had, how they responded to
17 those. So, it actually allows, certainly, a provider
18 community, agencies, others to get a quick fact sheet on the
19 most prominent interventions certainly being used widely,
20 not only by our network partners but by others, and we try
21 to keep those up-to-date. It's not an answer to you except
22 it's to say that we see ourselves as a resource providing
23 some access to that when it comes to children and families.

24 DR. STEVE MARANS: And, by the way, just to add, I
25 think in this situation, that resource has been enormously

1 sources for looking at and getting an overview about some of
2 the standards has been enormously helpful.

3 COMMISSIONER SCHONFELD: This is really a question
4 to the Panel. One of the challenges in -- you know, Steve,
5 you mentioned that it's important that we learn from these
6 experiences. One of the challenges, of course, is how one
7 does research in the immediate aftermath of a major crisis
8 event in a way that's both sensitive to those who are, you
9 now, victims or witnesses to these events, ethically done
10 and also scientifically valid, and the challenge of getting
11 informed consent in those situations, particularly when you
12 don't have a preexisting relationship with community. So,
13 if you could give me some thoughts of what are some of the
14 basic principals that you try and ensure are put into place
15 because this might be an important question that we can
16 grapple with in terms of recommendations for the state to
17 both facilitate but also to ensure that it's done in a
18 sensitive way.

19 DR. STEVE MARANS: Well, again, David, thank you
20 for your question. You know, over 20 odd years of
21 responding acutely and then beyond to tragic, awful events,
22 the last thing that we would ever do is talk to somebody
23 about informed consent. There have been lots of questions
24 that we have not been able to answer in a systematic way
25 that we would have loved to, but clinical care comes first.

1 helpful as had been other materials that have been developed
2 by many of us through our activities in the network.

3 COMMISSIONER SCHWARTZ: So, just to follow up a
4 little bit, with regard to trauma informed treatments for
5 youth, does the NCTSN stand as an arbiter of evidence based,
6 and would you say that double blind control trials are the
7 golden standard, or are there others?

8 DR. STEVE MARANS: Well, I'll see what Bob would
9 like to add to the first part of the question. We have not
10 served as arbiters, but have a great deal of experience
11 within the network and have some of the best people in the
12 country who have been involved in developing the scientific
13 approaches to testing treatments. And, as Bob said, the
14 availability of known information has been an enormous
15 resource that the Center has provided.

16 In terms of what is the gold standard, well, in
17 many ways, the randomized control trial has long been a gold
18 standard, but there is increasing appreciation of another
19 approach, which is an open trial approach, where using
20 sizable numbers, when one is able to, one is able to look at
21 trends and to be able to sometimes combine randomized
22 control trials with subsequent open trial approaches. And I
23 think that, you know, this is where the ability -- not for
24 every layperson in the public to have to learn about
25 scientific methodology, but to know where there are trusted

1 Stabilization comes first. There is a time, however, where
2 many people -- and, for example, in our early intervention
3 study, everybody has told -- and we need to have informed
4 consent even in order to use this standardized -- the data
5 that comes from standardized instruments that are part of
6 the treatment.

7 We have been really -- it's been really
8 interesting in other communities where often the -- we
9 shouldn't assume anything. We shouldn't assume, for
10 example, that people are always going to experience research
11 as exploitative because in some ways, one can often hear at
12 a certain phase in their recovery process that people want
13 others to be able to learn from their experience. So, I
14 think that one has to look very carefully at the specific
15 situations, and one has to think in a very specific way
16 about who the stakeholders are in making those
17 determinations even in terms of a bid.

18 And as a slight tangent, this also has to do with
19 media issues. We have a policy in our work that when we're
20 working with an individual or a community, we do not respond
21 to media questions about what we're doing and the issues
22 unless we're asked to by specific community members. But I
23 think this has similar implications in terms of this idea of
24 being extremely sensitive. What is the aim of the people
25 who are responding and why are they doing what they're

1 doing, and hopefully, hopefully, if there is a gold
 2 standard, it should always be first and foremost not just do
 3 no harm, but be motivated by the possibility that we have
 4 something to offer that's being asked for.
 5 DR. ROBERT PYNOOS: I'd just add to that that, you
 6 know, you're talking about a state -- I've been involved
 7 with doing research from very early days into long days, and
 8 hopefully that -- Oklahoma, after the bombing there, we,
 9 actually, with the governor's office, set up at the
 10 University of Oklahoma, a way to arbitrate. There were an
 11 enormous number of studies that wanted to be done and just
 12 flooding the community, so that there is a way to
 13 actually -- for the school systems, for others, to actually
 14 work through what are enormous requests and may not -- and
 15 to know that you're looking -- what you may need to look for
 16 at the beginning, what are those factors that people, even
 17 if they've been affected, want, actually, some knowledge to
 18 help guide the services afterwards. But it's open. It's
 19 transparent. It's done with good review. It's coordinated.
 20 There's IRB in the school district along with the university
 21 or others that are coordinated. That has to be all set up
 22 sometimes ahead of time, sometimes at the time, but that
 23 often doesn't happen, and it has to be supported.
 24 So, when I talked about the signature of an event,
 25 learning what the signature of the event is, in some way,

1 some transparency, and that is very hard to do when events
 2 happen unexpectedly in school systems that, obviously, were
 3 not planning for something like this. And having been in
 4 the situation of trying to raise that question acutely after
 5 the event, it was very difficult to really be able to
 6 discuss that because of all of the other, you know,
 7 realities that had to be faced.
 8 So, it might be an important contribution of this
 9 Commission if we could highlight some of the issues to
 10 consider so that that preparation could be done at a
 11 state-wide level and might be a model at a national level as
 12 well. There will be separate preparation that needs to be
 13 done to frame the research questions ahead of time so that
 14 they are actually relevant questions that are important
 15 questions, and that I would expect more coming from the
 16 scientific community. But in terms of policy decisions, you
 17 may be able to help lay the ground work by which this could
 18 be done responsibly, ethically and expeditiously after an
 19 event. So, perhaps -- I don't know if any of you are
 20 willing to prepare some of those recommendations and send
 21 them to the Commission. I know I'd be interested in seeing
 22 them.
 23
 24 (Hearing continues)
 25

1 actually helps guide the unique needs of responding to that
 2 event. That can be done in an open way with good research
 3 that has a needs assessment side to it that isn't just a one
 4 point in time because if you took one of those -- that
 5 six-month period, you'd be missing a lot. I mean, so you
 6 don't want to do research that is misguiding and
 7 overestimating or underestimating. It needs to be properly
 8 conducted with a sense of what the unique questions -- you
 9 don't want to just keep repeating dose of exposure. I mean,
 10 why do that. Why put that kind of burden on the community.
 11 But if there are some specific questions that need to be
 12 answered that can serve the community, you can do that in an
 13 open and transparent way, but it needs that pre-preparation
 14 between like a school district and the university, others,
 15 that often has to be guided by the governor's office.
 16 That's what our experience has been in a number of states.
 17 CHAIRMAN JACKSON: Time for one more. Dr.
 18 Schonfeld.
 19 COMMISSIONER SCHONFELD: Just to follow up because
 20 I know this wasn't something you were planning on
 21 discussing, so perhaps it's something you can follow up with
 22 the Commission and provide some information on. For one who
 23 has done schooled-based research, and I understand the
 24 importance of doing the research, I also know that this is
 25 difficult to do and it does require some pre-preparation and
